MICCOCLII.

From the unexpected length of some of the Between, they were found to be inconveniently bulk in the large type in which they were originally conposed, and they have been accordingly carefully reprinted in their posent form. In this elition the references were nearranged by the printers, reforming uniformly to the Officeal Descriptive and Librerated Catalogue; in all other respects the two elitions are perfectly identified.

WM. CLOWES AND SONS,

Printers to the Commission.

On the 3rd January, 1850, HER MAJESTY was graciously pleased, on the representation of the Society of Arta, Manufactures, and Commerce, of which His Royal Highness PRINCE ALBERT is President, to appoint a Commission for the purpose of conducting an EXHIDITION OF THE WORKS OF INDESTRY OF ALL NATIONS.

Among the duties entrusted by Her Majesty to the Commissioners, were the determination of the nature of the Prizes, and the means of securing the impartial distribution of them.

For this purpose certain general principles were laid down by Her Majesty's Commissioners, and Juries were appointed to whom the application of those principles was entirely left.

The present volume, containing the Decisions of Her Majesty's Commissioners upon this subject, the names of the persons to when the important duties of adjudication were entrusted, and the Reports submitted by the different Juries to the Commissioners, has been ordered by them to be published for general information, and a copy to be presented to every Exhibitor.

By Order of Her Majesty's Commissioners,

(Signed) Edgar A. Bowring, Secretary.

REPORT

OF

VISCOUNT CANNING,

President of the Council of Chairmen of Juries,

ON PRESENTING THE AWARDS OF THE JURIES TO THE ROYAL COMMISSION.

Council of Chairmen of the Juries, it falls to me to lay before your Royal Highness and Her Majesty's Commissioners the Reports of several Juries upon the subjects submitted to them for examination, and the names of the exhibitors whom they have judged entitled to rewards. In doing so, it will be convenient that I should state

briefly the Principle upon which, by the authority of Her Majesty's Commissioners, the Juries were constituted. The various Sobjects included in the Exhibition were divided, in the first instance, into Thirty Classes, Of these two were subsequently found to embrace fields of

these, two were subsequently found to embrace fields of action too large for single Juries, and were therefore divided into Sub-Jories. This increased the number of Acting Juries to Thirty-four.

Each of these Thirty-four Juries consisted of an equal unabor of Hirish subjects and of Fereigners. The Hrishs Juries were selected by Her Majesty's Commissioners from lists frashisch by the Local Commission of visions towas, each town being invited to recommend persons of skill and information in the manufacture or produce for which it is remarkable. The Foreign Juries were appointed by authorities in their own countries, in such relative parameters, the produce of the produce of the protein of the produce of the produce of the protein of the produce of the produce of the protein of the produce of the produce of the proposition of the produce of the protein of the protein of the produce of the protein of the protein of the produce of the protein of the protein of the produce of the protein of the produce of the protein of the protein of the produce of the protein of the produce of the protein of the prote

In the event of a Jury finding themselves deficient in technical knowledge of any article submitted to them, they were empowered to call in the aid of Ausociates. These Associates, who areted as advirens only, without a cote, but whose services were of the greatest value, were to the contract of the c

Each Jury was superintended by a Chairman, chosen from its number by Her Majesty's Commissioners. The Deputy-Chairman and the Reporter were elected by the Jurors themselves.

Such was the cosmittation of the Thirty-four Juries taken singly. They did not, however, set independently of each other, inasmuch as they were associated into six Groups, each Grony consisting of such Juries as had to deal with subjects in some degree of kindred nature; and before any decision of a Jury could be considered to faint and the subjects of the consistence of

The chief object of this provision was, that none of the many Foreign Nations taking part in the Exhibition object; and they recommended that this Medal should be

HAVING had the honour of acting as President of the should incur the risk of seeing its interests overlooked or Council of Chairmen of the Juries, it falls to me to lay neglected from the accident (as unavoidable one is many before your Royal Highness and Her Majetyl. Com-instances) of its being unrepresented in any particular

Each Group of Juries received the assistance of a Deputy Commissioner and of a Special Commissioner, appointed by Her Majesty's Commissioners to record its proceedings, to furnish in formation respecting the arrangements of the Exbibition, and otherwise to facilitate the

labours of the Juries composing the Group.
It was further determined by Her Majesty's Commissioners that the Chairmen of the Juries, consisting sioners that the Chairmen of the Juries, consisting hot British nebyles and of Foreigners in equal numbers, had be be formed into a Council; and that the dotte of the Council should be, to determine the conditions upon Council should be, to determine the conditions upon previously laid down by Her Majesty's Commissioners, the different Priess should be avanted; to frame rules to

guide the working of the Juries; and to secure, as far as possible, uniformity in the result of their proceedings. These are the most important features of the system npon which the Juries found themselves organized. I will now refer briefly to their course of action.

The Council of Chairmen, in proceeding to the discharge of their duties, were met at the outst by a serious difficulty. Her Majesty's Commissioners had expressed themselves desirons that merit should be remarded wherever it presented itself, but nations at the rame time to avoid the recognition of competition between individual Exhibitors. They had also decided that the Prires should consider of these processes of these Prices in software there; and that there could be a supported to the prices of the processes of the prices of

The Council of Chairmen found, to their regret, that it would be impossible to lay down ny rules for the awarding of the three Medals by which the appearance at least of enesting different degrees of success amongst exhibitors in the same branch of production could be avoided, Accordingly, after fully explaining their difficulty decodingly, after full explaining their difficulty to the country of the country of the country of the country of the Medals might be materially diminished, that one of the Medals might be withdraws.

Of the remaining two, they suggested that one, the Prize Medal, should be conferred wherever a certain standard of excellence in production or workmanship had been attained—utility, beauty, cheapness, adaptation to particular markets, and other elements of merit being taken into consideration according to the nature of the holiect and they recommended that this Medal should be awarded by the Juries, subject to confirmation by the Groups,

In regard to the inher and larger Medal, the suggested that the conditions of its award should be some important novelty of invention or application, either in material, or processes of mandatener, or eigenfaulty combined they great heauty of design: but that it aboud not be conferred for excellence of production or workmanily included for excellence of production or workmanily included and the second of the conferred to the conferred by the Group of a Jury, supported by its Group.

The principle that described met the views of He Modey's Commissioner, and was assessmelly further developed by them in a Minnie which they commissioned by them in a Minnie which they commissioned programs and the proposition of the proposition of the proposition of the Proviga Jarons. Many of these cally as regarded the Proviga Jarons. Many of these cally as regarded the Proviga Jarons. Many of these cally as regarded and the Proviga Jarons. Many of these cally a second the proposition of degrees of the provided of the provided provided

degrees of success attained by rival exhibitors. It was to be expected, therefore, that cases would arise in which the Council Medal, as the higher reward, would be asked for Exhibitors whose claims were only somewhat stronger in degree, without differing in kind from these of others to whom the Prize Medal had been awarded. In such cases it became the duty of the Conocil of Chairmen to refuse their sanction to the award of the Council Medal : without, however, necessarily impugning the alleged superiority of the article for which it was demanded. On the other hand, some instances have occurred in which they have felt themselves called upon to confirm the claim to a Council Medal, where the object for which it was claimed showed, in itself, less merit of execution or manufacture than others of its Class. It follows therefore that the award of a Council Medal does not necessarily stamp its recipient as a better manufacturer or producer than others who have received the Prize Medal. It is rather a mark of such invention, ingenuity, or originality as may be expected to exercise an influence upon industry more extended, and more important, than could be produced by mere excellence of manufacture.

This is to be borne in mind in considering the List of Awards which have the honour to lay before your Boyal Highness; and I trust it will be found that the Jaries have succeeded in doing justice to the Exhibitors of exnation and Class, and that they have not departed in any important degree from the purpose of Her Majestyle Commissioners.

One of the first instructions addressed to the Juries by the Conocil of Chairmen was to the effect that the Prizes should be awarded without reference to the country of the Exhibitors, the Exhibition being considered in this respect as recognizing on distinction of Natious.

It is gratifying to add that the Jarors of every country

cordially acquiesced in this principle, and that, notwithstanding unavoidable differences of opinion, uninterrupted harmony prevailed amongst them throughout the whole course of their labours. It is not too much to hope that the happy influence of this intercourse may extend and

endure far beyond the present occasion.
It is not necessary that I should detain your Royal
Highaess and Her Majesty's Commissioners with a recital
of the other instructions framed by the Council of Chairmen for the guidance of the Juries, or with a detailed
account of their proceedings in the discharge of their own
functions.

The number of Prize Medals awarded is 2,918. The number of Council Medals is 170.

It is important to observe that no more than one Medal of either denomination has been allotted to one Exhibitor in the same Class, although he may have contributed to that Class more than one article deserving of reward.

The Juries have found i Jas, in framing their Reports, to make Housenist Neutron Exhibitors whose Contributions were not such as to cutilte them to receive a Medal. Some have applied speciment or 17m state-find, which, although curious and instructive, do not imply any great merit of production on the part of the Exhibitor and others have furnished articles of manufacture which, without raching a high degree of receillence, are interesting as examples of the grocesses, or present condition of the trades which their illustrate.

Before concluding, I trust I may be allowed to add that it would be difficult duly to estimate the time and labour expended by the Jurors in their endeavour to discharge faithfully the important duty confided to them. The number of Exhibitors was about 17,000. Of these many, who were reckoned but once in the Catalogue, contributed a large variety of objects, and came within the province of more than one Jury; whilst in other cases towns, and even whole countries, were coauted as single Exhibitors, although they presented for examination every kind of manufacture and raw produce which their ingenuity and natural resources could furnish. Upon the whole, the task of the Juries involved the consideration and indement of at least a million articles; the difficulties attending it being not a little increased by the want of a uniform system of classification of the subjects in some of the foreign divisions, and by nnavoidable imperfections in the Catalogue.

In those circumstances the Juries can scarcely venture to hope that secidental omissions may not have occurred; but they have the satisfaction of feeling that these, if any, are not attributable to a want of care or diligence on their nart.

It now only remains for me, in laying the result of and relationar respectfully before your floyal Higness and for Majesty's Commissioners, to offer, on behalf of my Colleges and myself, our grateful a sketowieeligeneet of the bonourable confidence which you have placed in m; and to express the hope that we shall be found to have fulfilled our trust in a manner worthy of the noble undertaking in which we are proud to have been called upon to hear a part of the meaning the meaning of the meaning the manner worthy of the noble undertaking in which we are proud to have been called upon to hear a part of the meaning the meanin

APPENDIX A.

DECISIONS REGARDING JURIES.

final.

GENERAL CONDITIONS

Number

1. There shall be one Jury to each of the Thirty Classes, iuto which the Exhibition is divided The number of Jurors in each Jury is determined by the amount of articles exhibited in each Class, and the greater or less diversity of the subjects included in it. but

no abstract idea of the relative importance of the Classes is involved in the numbers attached to them, The following list describes the Thirty Juries, and the

number of Jurors to each Jury :-

A. RAW MATERIALS.

Manufactures, as Implements, or for Ornament 8 B. MACHINERY.

V. Machines for direct use, Including Carriages and Railway and Navai Mechaulsm VA. Carriages VI. Manufacturing Machines and Tools VII. Chil Engineering, Architectural and Building 12 Contrivances. VIII. Naval Architecture and Military Englacering; Ordnance, Armour, and Accoutrements. IX. Agricultural and Horticultural Machines and Implements .

X. Philosophical Instruments and processes depending upon their use; Musical, Horological, and Surgical Instruments Xa. Musical Instruments . 10

C. MANUFACTURES. - Textile Fabrics.

XIII. Silk and Velvet . Manufactures from Flax and Hemp

Mixed Fabrics, including Shawls, but exclusive of Wersted Gools (Class XII.).

XVI. Leather, Including Saddlery and Harness,
Skins, Fur, Feathers, and Hair.

XVII. Paper and Stationery, Printing, and Book-

binding XVIII. Woven, Spun, Felted, and Isid Fabrics, when shows as specimens of Printing or Dyeing, 10
XIX. Tapestry, including Carpets and Floor-cloths,

Luce and Embroidery, Fancy and Industrial Works XX, Articles of Clothing for immediate Personal or Domestic Use

D. Metallic, Vitreous, and Ceramic Manufactures

XXI. Cutlery and Edge Tonly

XXII. Iron and General Hardware.

XXIII. Weight Precious Metals, and in their
imitations, Jewellery, and all articles of
Virtu and Luxury, not included in the other 12

Classes 10 . Gines XXV. Ceramic Manufacture, China, Porcelain, Enrthenware, &c.

* The Jury for Agricultural Implements is made excepional, as the Agricultural Committee, consisting of eminont Members of the Royal Agricultural Society, have undertaken the functions of the Jury. Foreigners may be added to this Committee if desired.

- E. Miscellaneous Manufactures. XXVI. Decorative Furniture and Upholstery, includ-
- ing Paper Haugings, Papier Mache, and Ja-XXVII. Manufactures in Mineral Substances, used for building or decoration, as in Marble, 12
- State, Porphyries, Cements, Artificial Stones, &c. XXVIII. Manufactures from Animal and Vegeta
 - Substances, not being Woven or Felted, or included in other Sections XXIX. Miscellancous Manufactures and Small Wares 8
 - F. PINE ARTS. XXX. Sculpture, Models, and Plastic Art 15 218

4. A classified List of Subjects under the province of each Jury is prepared, and forms the limitation to each Class. Sury is prepared, and rorms too immitted to enew cases.

5. The Articles in the Building are arranged as much or possible in the 30 Classes, so as to be coincident with the field of action of each Jury, and to fiscilitate its labours.

6. If Exhibitors occept the office of Jurors, they cease to be competitors for prizes in the Class to which they are ap-pointed, and these cannot be awarded either to them indi-

vidually, or to the firms in which they may be parined sort of the man with the state of the sta 8. Juries may act in matters of detail by sub-committees, but no oward can be made except by the majority of the Jury. Before a Jury can finally make its awards, they must be submitted to a meeting of the Juries of allied subjects. os indicated in the groups in the Decision 3. Theso Meet-ings of allied Juries will have power to confirm the award of the Juries, and to investigate any disputed decisions. Before, however, the awards are published, they must be submitted to a Council, cumisting of the Chairmen of the Jaries, in order to secure uniformity of action—and a compliancewith the regulations originally laid down by that body 10. The awards of a Jury, when reported by the Council of Chairmen as being made in conformity to the rules, are

The Juries will commence their duties on Monday the 11. The Juries will commence their duries on Monday the 12th May, at 12 c chock, and will be added in the general transaction of the business by a person to be named by the Royal Commissioners, who by binnelf, or by a deputy to be approved in by the Commission, may be present at their deliberations, for the purpose of explaining the rules of the Commission. This Nominee of the Commission will not have a vote in any of the Juries, or at all interfere in the

adjudication of awards. CONSTITUTION OF JUNIUS.

 The Jury will in general consist of an equal number of British subjects and of Foreigners.*
 If Foreign Commissions do not send a sufficient num- If Foreign Commissions do not send a sufficient num-ber of Foreigners to represent one-half of the Jurors in each Class, the deficient numbers may be completed by the apones, me accurrent numbers may be completed by the ap-pointment of British subjects.

14. Country as well as metropolitan districts will be represented on the Jury.

* The following list contains the actual number of the

Jarors sent by each country: Russia . Austria. . . . 14 Slelly . Belgium Denmark Spain Egypt Switzerland . France Sweden Great Britain . . . 160 North Germany Zollverein . . 23 Holland . . . Total . . . 183 Portugal .

15. Each Jury will be presided over by a Chairman to be noninated by the Commissioners, and he will be aided by a Deputy-Chairman to be elected by the Jury. 16. Juries may appoint one of their own body as a Reporter.

COUNCIL OF CHAIRMEN.

17. The Chairmen of the Thirty Juries will be associated as a body, to be called the "Council of Uniframen."

18. In the absence of a Chairman, the Deputy-Chairman will take his seat at the Council.

19. The Council of Chairmen will be constituted, as far

as practicable, of British subjects and Foreigners in equal

numbers.

20. The first and chief duties of the Council of Chairmen

will be to frame the rather for the guidance of the Juries.

21. The Cosmical will sub-have to describe the conditions nation which the 1st, 2nd, and 3st Class Steldar respectively which is the 1st, 2nd, and 3st Class Steldar respectively which is will be activated to confirm in the asserts in the sorteral departments of the Ishibition. It is the wish of the Commission that Methal should be asserted. In most comparison that Methal should be asserted in most superiority may be, and not with reference to a merely insisting analysis. The three theorems of Media to an and as not a first, second, and third in degree for the same can into as first, second, and third in degree for the same class of subjects.

* The fellowing decisions relative to Prizes and Jories, already published, are repeated for the purpose of more detailed information:—

orance merentions;—merentions;—taxe had under their consideration the suiject of the Prizes to be marsied to exhibitors, and have resolved to take immediate seeps for having times) Mankels struck of cardious sixes and different its will, generally speaking, he mest desirable that the remark should be distributed. The phear devided to select account, the considering that the phear devided to select account, to considering that metals to be before excluded, commercing that metals to be before excluded and any other fart the development of superior skill and, han any other fart the development of superior skill and

than any other for the development of superior skill and longenuity in the medallic art, and at the sancot time the most likely to constitute a lasting memorial of the Exhibition. "With regard to the most in which the Prices are to be awarded, the Commissioners think it inexpedient to establish beforehand rotes so precise as to fetter the discretion of the Jurice upon which that task will ultimately devolve. It will he sufficient for the present to indicate the general prioriples

to which it will probailly be a tvisable to conform in the award of Prizes for successful competition in the several departments of the Exhibition.

"In the department of Raw Mattana axis Danice, for Instance, Fixus will be awarded upon considerations of the state and Impartance of the article, and the approximation of the article and impartance of the article, and the approximation of the Enkhlidten, the Jaries will take into account in based on the Enkhlidten, the Jaries will take into account in our top and impartance of the prepared profile, and the supports of the propared profile, and the support of the propared profile, and the support in the several take the profile of the profi

In the use of the article exhibited. The importance, in a social or other point of view, of the purposes to which the article is to be applied, will also be taken into consideration, as will also the amonot of the difficulties overcome in bringing the invention to perfection.

"In this department of M-swractrum, those articles will be rewarded which fulfil in the highest degree the conditions specified in the sectional like, viz.: - Increased usefulness.

he rewarded where main in this ingener acgree me containings specified in a contract of the properties of the properties

Power. As r, the rewards will have reference to the beauty and originality of the specimens exhibited, to improvements in the pracesses of production, to the application of art to manufactures, and, in the case of models, to the interest attaching to the subject they represent.

"Those general indications are sufficient to show that it

ts the wish of the Commissioners, as far as possible, to reward articles in any department of the Exhibition which may

 The Council of Chairman must see that the awards of the Individual Juries are in accordance with the rules before they are considered final.

23. Although the Commissioners may be disposed, under peculiar cfreumstances, as as the forth in the unisermentioned decision. It consider the propriety of peculiary grants to individual exhibitors, they will only take such application pluc consideration on the recommendation of the several

Into consideration on the recommendation of the second parties, anothernously the Council of Chairmen. 23. As some of the most important duties of the Gueries, it of Chairmen are preliminary to the action of the Juries, it is necessary that they should meet one week pretions to the assembling of the Juries. The daties of the Council will

is necessary that they should meet one week previous to the assembling of the Juries. The daties of the Council will therefore commence on Monday, the 5th of May. 25. In order to represent the wishes of the Commission, and to explain its rules, o nomines of the Commission will attend the meetings of the Council, and aid it in the transaction of business; but he will not possess a vote, as act as a member of the Council.

Mode of Appointing the Esglish Jugors.

26. Those towns which exhibit to a considerable extent in any of the Clauses will be invited to send a list of names of persons who would efficiently represent the knowledge of those Clauses as Jurors.

37. It will be proposed to state according to the clausification.

times to according to the classified.

27. It will be necessary to state, according to the classified.

27. It will be necessary to state, according to the classified.

28. As it is necessary to reduce the lists to the standard to aggregate.

28. As it is necessary to reduce the lists to the standard.

20. As it is necessary to reduce the lists to the standard number for each Jury, the Commission charges itself with this duty.

29. Those persons who have been recommended as Jurous.

but who from the small numbers of the Jury are not placed on it, may, on the application of a Jury, be called it on special occasions, to give aid, under the title of Associates, but without a vote.

31. The Jurors, on being appointed, will receive immediate notice of appointment, and their names will be

countries which they represent,

32. The Chairman will be required to meet on Monday the 5th May, at 10 o'clock.

33. The Juries will meet for the transaction of business,

33. The Juries will meet for the transaction of business, on Monday the 12th May, at 10 o'elnet.
34. Atthough impossible to set apertapecial days in which the Juries about ean examine the Articles exhibited, to the exclusion of the public, arrangements will be made to early on three examinations with as little delay as possible.

35. Jurors, immediately on their arrival in London, are requested to report themselves at the Jury Office, in the Exhibition Building, where they will obtain their Jurur's Ticket, and receive all necessary information.

APPENDIX A 1.

CLASSIFICATION OF SUBJECTS IN THE THIRTY CLASSES INTO WHICH THE EXHIBITION IS DIVIDED.

RAW MATERIALS,

I. Mining, Quarrying, Metallurgical Operations, and Mineral Products. II. Chemical and Pharmoceutical Processes and Products generally

111. Substances used for Food IV. Vegetable and Animal Substances, chiefly used

in Manufactures, as Implements, or for Oronment.

MACHINERY.

N. Machines for direct use, including Carriages and Railway and Naval Mechanism.
 VI. Manufacturing Machines and Thols.

VII. Civil Engineering, Architectural and Building Contrivances.

VIII. Naval, Architectural, and Military Engineer-ing; Ordnance, Armour, and Accourtements. IX. Agricultural and Horticultural Machines and Implements.

X. Philosophical Instruments and Processes d pending upon their use; Musical, Horological, and Surgical Instruments.

MANUFACTURES,

XI. Cotton. XII. Woollen and Worsted,

XIII. Silk and Velvet.

XIV. Manufactures from Flax and Hen XV. Mixed Pabrics, including Shawls, but exclusive of Worsted Goods (Class XII.). XVI. Lenther, including Saddlery and Harness, Skins, Fur, Feathers, and Hair.

XVII. Paper and Stationery, Printing and Booklanding.

XVIII. Woven, Span, Felted, and laid Fabrics, when shown as specimens of Printing or Dyeing. XIX. Tapestry, including Carpets and Floor-cloths, Lace and Embroidery, Fancy and Industrial Works

XX. Articles of Clothing for immediate Personal or Dumestie Use.

XXI. Cutlery and Edge Tools. XXII. Iron and General Hardware

XXIII. Working in precious Metals, and in their imitations, Jewellery, and all articles of Virta and Luxury, not included in all other Classes. XXIV, Glass.

XXV. Ceramic Manufactures, China, Porcelsin, Farthenware, &c. XXVI. Decorative Furniture and I pholstery

cinding Paper-hangings, Papier Maché and Japanned Goods. XXVII. Manufactures in Mineral Substances, used for building or decoration, as in Marble, Slate,

Porphyries, Cements, Artificial Stones, &c. XXVIII. Manufactures from Animal and Vegetable Substances, not being Woven or Felted, or in-cluded in other Sections.

XXIX. Miscellaneous Manufactures and Small Wares, FINE ARTS.

XXX. Sculpture Models and Plastic Art.

I. Mining, Quarrying, Metallurgical Operations, and Mineral

A. MINING AND QUARRING OPERATIONS. I, Quarries and upon workings.

Streaming; washing alluvial deposits. Mines worked on the tode.

a. Ninking of shafts.
b. Cutting sdits.
c. Driving levels.
4. Mines worked on the bed.

a. Sinking shafts.
b. Driving levels.

c. Cutting stalls or headings. alt deposits.

6. Ventilation; Safety Lamps, and other modes of lighting. 7. Methods of raising Men, Ore, and Water.

o. Raising Ore.
b. Lowering and raising Miners.
c. Dralning.

B. GEOLOGICAL MAPS, PLANS, AND SECTIONS.

C. OHER AND METALEURGICAL OPERATIONS. 1. Ores, and the Methods of deessing and rendering Ores merchantable.

a. Ores of the taure common Metals, as of Iron,

 Orea of the harve common Metals, as of Iron, Copper, Zinc, Tin, Lead.
 Native Metals, as Guid, Silver, Copper, &c.
 Orea used for various purposes, without reduction, as Peroxide of Manganese, &c.
 Methods of reasting, smelting, or otherwise reducing Ores.

a. The common Metals, as Iron, Copper, Zine, Tin, Lead The Metals more generally used in combination, as Autimony, Arsenic, Bismuth, Cadmium, Co-balt, Nickel, &c.

balt, Nickel, &c.
 Methods of preparing for use the nobler Metals, as Gold, Silver, Mercury, Paliadium, Platinum, &c.
 Adaptation of Metals to special purposes.
 Metals in various Chesnical states, as Irou in the condition of Cast und Malleubio iron, Steel,

Metals in their progress in finished Manufactures, as Pigs and Ingots, Sheets, Bars, Wites,

80. 5. Afloys, and methods of ren lering more generally seful metals and their alloys

o. Statuary, Bronze, Uno, Bell, and Speculum Me

A. Brass, and alloys used as a substitute for it.

- e. White alloys, as Britannia Metal, German Silver, Pewter, ke d. Type, Sheathing Metals, and other alloys.
- D. NON-METALLIC MINERAL PRODUCTS. I. Minerals used as Fuel
 - n. All kinds of Coal and derived products. b. Lignite and Peat e. Buuminous bodies and antive Naphtha.
 - 2. Massive Miserals used in construction n. For purposes of construction generally-Siliceous or Calcureous Free Stones and Flags.
 - Granites, Perphyritie and Besuitie Rocks. Slates b. For purposes of Ornament, Decoration, and the Fine Arts -
 - Marbles. Alabanter, Sinc. &c.
 - Screenting and other hard rocks susceptible of high polish.
 - c. Cements and Artificial Stones-Calcareous and Hydraulle Cements. Puzzuolanas, Trass, &c.
 - Gypsum for plaster. Artificial Stenes 3. Minerals used in the Manufacture of Pottery and
 - Sands, Limestones, &c., for Glass-making. Various Clays and felapathic Minerals, as those
 - used for Bricks, Tiles, and various kinds of Pot-tery and Porcelain. Siliceous, Calcareous, and other Minerals, used in Plastic Arts.
 - 4. Minerals used for personal Ornaments, or for Mechanical and Scientific purposes.
 - a, Gems and precious Stones.

 b Models of Minerals and Crystals, &c.
 c, Collections of Minerals for scientific or educa-
 - 5. Minerals used in various Arts and Manhfacture n. Simple bodies or compounds containing the Al
 - kalies or Alkaline Earths Those used principally for culinary purposes or for Medicine, as Salt, Mineral Waters, &c. Those used in various manufactures, as Sul-
 - These used in various manufactures, as surphur, Boras, &c.
 b. Earthy and semi-crystalline Minerals.
 Minerals used for grinding and polishing, as
 Grindatouce, Honestones, Emery, &c.
 Lithographie Stones, Drawing Chalks, and
 Slate Peucils.
 - Graphite. Earthy and other Minerals used as pigments, Earthy and oller Minerals used as pigments, or for staining, dyelng, and colouring. Various Minerals used in Manufactures; as Alum, Sobist, Fuller's Earth, French Chalk, Casting Faods, 6. 6. Solls and Mineral Manures.
 - 11. Chemical and Pharmaceutical Processes and Products
- generally. A. CHEMICAL SCENTANCES USID IN MANUFACTI DE.
 - 1. From the Mineral Kingdom.
 - a. Nun-metallic substances Those used principally in their elementary state, as Sulphur, Phosphorus, &c. Acids, as Sulphurie, Muriatic, Nitric, Boracie,
 - Sec. Miscellaneous Manufactures, as Sulphuret of
 - Carbon, Chloride of Sulphur, &c. b. Alkalies, Earths, and their compound Alkalies and their Alkaline Salts, as Soda, Pot-
 - asb, Ammonis, and the Carbonates, &c. Neutral Salts of the Alkalles, as Sulphate, Nitrate of Soda, Saltpetre, Borax, &c.
 - trate of Soda, Saltpetre, Borax, &c.
 Earths and their compounds, as Lime, Magnesis, Barytes, Strontia, Atumina, &c.
 e. The compounds of Metals proper, as Salta of
 Iron, Copper, Land, Southern, Southern,
 d. Mixed Chemical Manufactures, as Prussiste of
 - Potash, &c. 2. From the Organio Kingdom, and not included in
 - Sections III, and IV.

 3. Manufactured Figurents, Dyes, and miscellaneous Chemical Manufacturers. (See also Section IV.)

- a. Pigments employed in House Decoration, and for colouring Woods.
 b Pigments used for Textile Fabrics.
- c. Pigments used for Paper Hangings, and for felted and laid Fabrics generally.
 - Artists' Colours. c. Miscellaneous Chemical Manufactures
- B. RABER CHEMICAL SUBSTANCES MANUFACTURED CHIEFLY TOR THE EST OF THE SCH STIFFE CHEMIST. I. From Substances of the Mineral Kingdom,
- Vegetable 11 C. CHENICAL SUBSTANCES USED IN MEDICINE AND IN PHAR-
 - MACL
 - 1. From the Mineral Kingdom.
 2. Non-metallic substances and their compounds.
 3. Alialies, Earths, and their compounds.
 4. Alialie Proparations.
 5. From the Vegetable Kingdom, when shown for
 - Pharmaceutical Purposes. (See also Scetlens III. and IV.)
 - a, Vegetable Infusions, Decections and Solutions, elear or saccharine. b. Thetures.
 - c. Extracts and Inspirated Juices. d. Resins, Gum Resius, and Olco Resins, and
 - Balsams, Aloes, &c.
 - e. Aloes, &c. f. Gums as Acacla, Tragacenth, &c. g. Essential Offs, Calput, Savine, Turpentine, &c. & Essential Offs, Calput, Savine, Turpentine, &c. & First Olis, N. Calor, T. Otton, Almond, Ulive, &c. & Vegetable parts, as leaves of Digitalis, Hemlock, roots of Japan, Ipeccanaha, &c. j. Barks as Imported, Cinchona, Cascarilla, Cussaria &c.
 - paris, &c. paris, &c. & Vegeto-Alkalies, their Salts and other Crys-
 - talline principles of medicinal substances.

 I. Vegetable Acids.
 - m. Miscellaneous Compous 3. From the Animal Kingdom. a. Cod-liver and other Animal Oils for Internal or external application.

 b. Ungueots of Spermacetl, Land. Oil, and combi-
 - nations of them. c. Autispassoodies, as Musk, Castoreum, Civet,
 - Ambergris, &c.

 d. Phosphurus, Ammonia, and their products,
 r. Irritants, as Cantharides. f. Antacids, as Crab's-eyes, Calcarer as concretions of the Craw-fish, Cuttle-bone, &c.
 - III. Solstonces used as Food.
- VEGETABLE KINGDOM. A. AGRICULTI RAI. PRODUCE -- CEBEALS, PURES, OHS,
 - SEEDS, ETC. I. Common European Cereals.
 - Cercals more rarely cultivated in Europe.
 Millet and other small Grains used as food. 4. Pulses and Cattle Food.
- 5. Grasses, Fodder Plants, and Agricultural Roots.
 6. The Figure or preparations of the above classes.
 7. Oil Seeds and their Cakes.
- S. Hops and other aromatic plants used for like pur-
- B. Daien FRUITS AND SEEDS. 1. Raisins, Currants, Figs, Plums, Cherries, Apricots,
- 2. Dates, Tamarinds, Dried Bananas, &c. 3. Almonds, Chesnuts, Walnuts, &c.
- 4. Cocca-nuts, &c. C. SCRPTANCES USED IN THE PRETABATION OF DRINKS.
 - I. Real Teas of all klods, 2. Substitute for Tens, as Paraguny, Arabian, Benego-
 - 3, Coffee of all kinds, and Cocoa Seeds and Nibs. Various substances, as Chicory Roots, Amande de Terre, Gusrana Bread, &c.
- D. INTOXICATING DIM GS, FURMENTED LIQUODS, AND DIS-
- . I. Fermented Liquors and Spirits from unusual sources. 2. Tobacco.

- 3. Opium. 4. Itemp, and other lotoxicating Drugs.
- E. SPICES AND CONDEMENTS.
 - Cimaamon, Cassia, and their substitutes.
 Nutmers and Mace; Cloves and Cassia Buds.
 Peppers, Capsicum, Mustard, Vanilla, Pimento, Caramums, &c.
 - 4. Ginger, Turmerie, &c
- F. STARCH SERIES. I. Starebes of all kinds prepared from Wheal, Rice,
 - Potators, Maize, &c Arrowroots of all kinds, Tois les Mois.
 Sagos from the Palms, Cassava, Tapioca, &c.
 - 4. Lichens of all kinds.
- 5. Other Starchy Substances, as Portland Sago from Arum suculatum, and from various like plants. G. SCOAR STRIES.
- 1. Sugars from the Cane and Beet. daple and Palms Birch, Poplar, Oak, and Ash, Grape Sugar
 - 2. Liquorice, Sarcocoll, &c.
- ANIMAL KINGDOM. H. ANIMAL FOOD AND PREPARATIONS OF FOOD AS INDUS-TULAL PRODUCTS.
 - pecimens of preserved Meats.
 - Specimens of preferred parents.
 Portable Soups, and concentrated nutriment, as consolidated Milk, &c.
 Caviare, Trepang, &c.
 Articles of Lastern commerce, as Shark Flas, Nest of
 - the Java Swallow, &c. 5. Honey and its preparations.
 6. Blood and its preparations.
 7. Industrial Products, as Glue, Gelatine, Isinglass,
 - Gluten, &e.
- IV. Vegetable and Animal Substances, chiefly used in Manufactures, as Implements, or for Ornaments.

VEGETABLE.

- A. GUN AND RESIN SERIES. 1. Gums of all kinds of natural occurrence-
 - Gums made artificially, as British Gum. Mucilagiaous Seeds, Barks, Pods, and Seaweeds 2. Resing-
 - Resins and Balsams of all kinds. Gum Resins. Sum Elastics and Gutta Percha.
 - Distilled Reslus and Varnishes.
- B. OIL SERIES.
 - Yolatile Oils, including Campbor.
 Drying Fat Oils.
 - 3. Non-drying Fat Oils. 4. Solid Oils. 5. Wax.
 - 6. Distilled Fat Oils.
- C. ACIDS, AS ACETIC, CITRIC, TARTARIC, OXALIC, &c.
- D. DYES AND COLOURS.

 - Dia active.

 J. Indigos.

 J. Malders.

 J. Malders.

 J. Lichens and their preparations.

 Dying Barks, as Acacins, Quercitron, Mangrove, &c.

 Woods, as Log-wood, Brazil-wood, Peach-wood, Fus-
 - 6. Flowers and Berries, as Persian Berries, Saffower, Saffron.
- 7. Miscellaneous, as Turmeric, &c. E. TANNING SUBSTANCES.
- TANNISO SUSTANCES.

 1. Pods, Berries, Scela, and Fruits of various kinds, as Algarous, Acacia, Nib-alb and Divi-divi Peds, &c., 2. Barks of various kinds, as Barks of the Baboul, Brazilian Acacias, Muricl, Buelda, Gordonia.

 3. Galla, and similar Tanoning Materials.
- 4. Catechu, Kiao, Gambeer, &c. F. Finbous Surstances, including Materials for Cornage
- AND CLOTHING.
 - 1. Cottons of all kinds
 - 2. Hemp and Flax; Manilla Hemp and New Zealand Flaz.

- 3. Chiaa Grass, Nettle Fibre, Plantsin, and Pine Ap-
- ple Fibre.
 4. Sunn, Jute, and other tropical substitutes for Hemp, Flax.
- 5. Colr. or Cocos Nut Fibre, Gomuth &c. 6. Rushes and Miscellaneous Substances G. CELLELAS SUBSTANCES.
 - 1. Corks of all kinds. 2. Woods and Roots used for Corks, as the Ochrona
 - Anony paint room used for County as and Anony painteris.

 3. Rice-paper of Chius.

 4. Birch Bork, Pottery Bark, Citrus Rind, &c.
 - 5. Substances used as Amadou
- H. TIMBER AND FANCY WOODS ESED FOR CONSTRUCTION AND ORNAMENT, AND PREPARED BY DYFISO.
 - 1. Saited chiefly for purposes of construction, or for the Navy.

 2. Suited chiefly for Ornamental Work.

 3. Prepared Woods, as by Kyan's, Payne's, Bethell's,
- and Boucherie's processes. I. MISCELLANDOUS SUBSTANCES.
 - I. Substances used as Sonp, as Quillal Bark, Sonp Berries (Supindus suposaria), Soap Roots (Sonosaria officinalis, &c.). 2. Perfumes, as Pucha Pat, Vetiver, Spikenard, Tonka-
 - beans, &c. 3. Substances used mechanically, as Teazels, Dutch Rushes, &c.
 - Scels and fruits used for Ornamental purposes, as Ganitrus Bends, the Ivory Nut, the Doom Palm, Coquilla Nuts, Bottle Gourds, &c.

ANIMAL. J. For Textile Farrics and Clothing.

- 1. Wool, Hair, Bristies, Whalelsones. 2. Silk from the Silk-worm Bombyr mori, and from
- other species in Iudia, e. g. Bombyvilla Cynthia and Attiens Paphia. 3. Feather, Down, Fur, Skins.
- 4. Miscellaneous, K. For DONESTIC OR ORNAMENTAL PURPOSES, OR FOR THE
 - MANUFACTURE OF IMPLEMENTS. I. Bone, Horn, Hoofs, Ivory, Tortoisesbell, Shagreen, Chatlie
- 2. Pearls. Seed Pearl, Mother-of-Pearl, Coral, and Shells generally.

 3. Oils. Tallows. Spermaceti, Wax. Land
- 4. Miscellaneous, as Sponge, Goldbeater's-skie, Catgut, Silkworm-gut, Bladders, &c.
- L. AS AGENTS IN THE MANUFACTURE OF VARIOUS ARTICLES. I. Glue, Isinglass, Gelatiac, Bone-black, Ivory black, Animal Charcoal.
 - M. FOR THE PRODUCTION OF CHEMICAL SUBSTANCES. Blood, Bones, Horns, &c., for the production of Phos-phorus, the Prusslates, the Superphosphates, &c. N. FOR PRIMERTS AND DYES.

 - Cochineal and Carmine.
 Dyes from the Galls of the Aphides. Gail-stone, pigment from Ox-gall
 - 4. Indian dyes from the Coreus, the various kinds of
 - 5. Miscellaneous, as Sepia, Enena d'Orient, &c.

MACHINERY.

- V. Machines for direct use, including Carriages and Railway and Naval Mechanism.
- A. STRAM ENGINES AND BOILERS, WATER AND WIND MILLS,
 - AND VARIOUS OTHER PHIME MOVERS. . Boilers
- 2. Land Engines.
 3. Murine Engines.
 4. Windmills.
- 5. Water-wheels and Turbines,
- 6. Water-pressure Engines, as Illchenback's and Arm- o
 - strong's.
 - Vacuum Power Engines 8. Electro-Magnetle Engines, &c. 9 Miscellansons

viii	CLASSI	FICATION OF SUBJ
B.	SEPARATE PARTS OF MACI	INTS, SPECIMENS OF WORKS
	I. As heavy Castings or	Forgings In the rough; (
	ings or Forgings,	ATTR and GAS Works in V Forgings in the rough; (plain, intricate, or beautifu (in Metals, mit faished Work in Me- regular Figures, &c. 8, Governors, &c.
	2. Specimens of Tarning	in Metals.
	3. Specimens in filing a	arl finished Work In Me
	4. Vnives, Cocks, Piston	s, Governors, &c.
C.	PRESMATIC MACHINES.	
	1. Air Pumps, 2. Blowing Fras. 3. Blast Engines for Fur 4. Miscellancous.	
	3. Blast Engines for Fut	naces, &c.
D,	INTERACTION MACRINES, C.	RANGE, ETC., PILE DELVERS,
	L. Hydraulle Machines Pumps and Fire E. Water Rama, Hydraulie Presses,	
	Pumps and Fire E	ngines,
	Hydraulie Presses,	&c.
	Any sort of Crane:	motion mid contrivances, J. or Windlasses, Capstans, E.) also VII, A.) steam, nes,
	of nil sorts. (F	or Windlasses, Capstans,

CULTURAL

1. Manufacturing Machines and Tools, or systems of Machinery, Tools, and Implements employed for the underseentioned purposes,

L. MANUFACTURES OF ALL SPUN, WOVEN, FELTER, OR LAID FABRICS. Michinery for the complete formation from the Row Material of all Pabrics of Cotton, Wool, Flax,

Hemp, Silk, Caoutchoue, Gutta Percha, Hnir, Paper-making and Staining.
 Printing and Bookbinding.

3. MANUFACTURES OF METALS. 1. The manufacture of Metals from the Ore into Bars, Rods, Wire, Sheets, and other general forms; also easting and polishing of Metal, &c.

easting and polishing of Metal, &c.

The cutting and working of Metals by Markine
Tools, such as Lather; Machines for Pinning,
Drilling, Boring, Slotting, Sawing, Stamping,
Shearlog, Riveting, Punching.
Machines and Tools used by the Makers of Gold,
Silver, and Plated Goods.

4. Machines and Tools used by the Makers of Cutlery,

Nnils, Screws, Pins, Needles, Buttons, and metallie Pens, &c.
5. Machines and Tools used by Locksmiths, Dicsinkers, &c.

MANUFACTURES OF MINERAL SUBSTANCES AND MINING MACHINERY. (See also SECTION I.)

 Much lines and Tools for the preparation and working of all kinds of Glass, Stone, Granite, Alabaster, Slate, Clay, &c.

2. Machines and Tools used in the preparation and

working of Gems, &c. MANUFACTURES OF VEGETABLE SUBSTANCES

 Machines and Tools for the preparation and working of all kinds of Wood.
 Mills and other machinery for Grinding, Crushing, or preparing Vegetable Products.

Mancracture of Annal Sustances.

Muchinery and Tools for working in Horn, Bonc,
Ivory, Leather, &c. MACHINERY AND APPARATUS FOR BREWING, DISTILLING,

AND MANUFACTURING CHEMISTRY.

II. Civil Engineering, Architectural and Building Con-tricunces. POUNDATIONS AND BUILDING CONTRIVANCES CONNECTED

WITH HYDRACLIC WORKS. Application of the Screw Pile for the Foundation of Piers, Jetties, &c., Beacons, and Ships' Moor

of Fiers, Jetties, ac., Beacots, ma Sups Accor-ings.

2. Pocumatic Piling, Machinery illustrative of the mode of shaking and guiding the Cylinders, also Contrivences for overcoming difficulties where obstructions are offered to their shaking.

3. Coffer-doms on soft and rocky bottoms, and Apparatus connected with them.

Foundations of Lighthouses exposed to the violent action of the sea. 5. Diving-bells, Helmets, and Apparatus connected

with them.

6. Boring Tools, and Contrivances for ascertaining the stratification on Sites of intended Structures. SCAPPOLDING AND CENTERINGS.

Scaffolding for the erection of Brick Chimney Shufts, Columns of Masonry, Towers, and Spires.
 Portable Scaffoldings, Ladders, and Fire Escapes.

 Fortable Scannings, Laurers, and Five Escapes.
 Seaffolding for the creetion of Monolithic Blocks, as Obelisks, &c., and for the hoisting of great Weights.

- Fixed and Turning Scaffolding for the repairs, &c., To Homes, &c., internally and externally.
 Scaffolding and Contrivuoce fur the erection of large Girler Bridges (as Britansia Bridge).
 Centerings for Arrival Bridges, Dames, and Vault.
 Centerings for Turnela, Shirlds, and Contrivuance for Incilitating their exercisation.
- C. BRIDGES, TUNNELS, AND ENGINEERING CONTAINANCES FOR CROSSING RIVERS, RAVINES, &c.
 - Timber Bridges Cast-iron Bridge Castiron Bridges

 Fromptheim Bridges

 Fromptheim Bridges

 Fromptheim Bridges

 Fromptheim Bridges

 From and Rolling Bridges

 Drive and Rolling Bridges

 From the Bridges

 From

 - r loating Bridges, as across the Hamedze, and receive Railway Trains, as across the Humber.
 Examples of Brick and Stone Bridges.
- D. DOCK, HARBOCK, RIVER, AND CANAL WORKS. 1. Docks and Slips for the building and repairing of
 - 2. Mercantile Docks, and Arrangements connected therewith, for the loading and unloading of
 - 3. Sea and Capel Locks, Gates and Entrances, Stop-
 - gates, Sluices, &c.
 4. Marine Railway Slips and Hydraulic Docks.
 5. Harbours of Refinge.
 6. Breakwaters, Piers, Jetties, Wharfs, and Landing-
 - 7. Groynes, Sen-defences, &c.
 - 8. Perpendicular Lifts for Canals, and other Engineering Contrivances instead of Locks.
 9. Dredging-machines, Hedgebogs, and other Machines. employed in Harbour Works, for removing Shoals,
- E. LIGHTHOUSES AND BEACONS.
- F. ROOFS, BUILDINGS, AND CONTRIVANCES FOR COVERING
 - LABOR AREAS.
 - Examples of Timber and Iron Trusses.
 Roofs for Markets, Railway Stations, &c.
 Roofs for Theatres.
 - 4. Fire-proof Buildings, arranged so as to be applicable to the conomical methods of construction. 5. Coverings for Boots.

nected therewith.

- G. Water-Worse, and the Engineering Contrivances connected with the Ohtaining, Stoning, and Distribution of Water is Towns.
 - 1. Well-sinking and Boring, and the Apparatus con-
 - 2. Storing, Filtering, and Distributing Reservoirs, and the Contrivances connected with them. 3. Contrivances for maintaining and producing efficient Heads and the Apparatus connected with Street
 - 4. Services, and Apparatus connected with Domestic
- Water Supply (See also V., B.) H. GAS-WORRS, AND CONTRIVANCES CONNECTED WITH THE ECONOMICAL PRODUCTION OF ANTIFICIAL LIGHT.
- ECONDRICAL L'EDUCTION DE ARTIFICIAL LIGHT.

 Rendeming, Separating, and Portfying Apparatus.

 GOVERNORS and Contrivances connected with the

 Mains for the Distribution of Gos. (See also

 XXII.)
- 1. SEWERAGE, CLEANSING, PATINO, AND THE CONTRIVANCES
 CONNECTED WITH THE NANITARY CONNECTED BY
- Towns. 1. Forms of Sewers, their Entrances and Junetions
 - 2. Contrivances for Cleansing, Flushing, and Ventilating Sewers.
 - Contrivances for removing and distributing Sewage. Traps, and other Means of preventing emanations. (See also XXII.)
- 5 House Drains, and the Internal Sanitary arrange-ments of Houses. (See also XXII.) 6. Pavements.

- J. WARNING AND VENTILATING DOMOSTIC RESIDENCES AND
- Arrangements for Warming, as with Hat Air, Water, Steam, &c.

 Contrivances for preventing Smoke, and Chimneysweeping Machines.
 - 3. Contrivances for Ventilation on a large Scale.
- K. MISCELLANDOUS.
- al Architecture, Military Engineering; Ordnance, Armour, and Accountements.
- A. ILLUSTRATIONS BY MODELS OF SHIPBUILDING FOR PUR-POSES OF COMMERCE.

 - 1. Ships.
 2. Barks.
 3. Brigs and Brigantin
 4. Snows and Ketches.
 5. Nehomers.
 6. Stoops and Cutters.
 Z. Luggers, Barges, &c
- ILLESTRATIONS BY MODELS OF SHIPBULLING FOR PUR-

 - 1. Ships of the Line.
 2. Frigates.
 3. Skops, Corvettes, and Brigs.
 4. Cutters, Brigantines, Ketches, Schooners, Barges, &c.
 5. Bomb or Mortar Vessels, Fire-ships, Gun-boats, &c.
- C. ILLUSTRATIONS BY MODELS OF SHIPBUILDING FOR THE ACPLICATION OF STEAM OR OTHER POWERS.
- Great War Steamers.
 Steam-vessels of large hirden for long Passages.
 Steam-vessels for Inland, River, or Lake Navigation.
 Sailing-vessels fitted for the temporary appliance of Steam or Human Power.
- D. VESSELS USED FOR ANUSEMENT, AND SMALL VESSELS
- Sengoing Yachts of all Kinds.
 River Yachts, and Pleasure Bests of a smaller class.
 Rowing Boats of all Kinds.
 Fishing Boats and Vessels.
 Life Boats and Paddit-box Boats.
- ANCHORS, WINDLASSIE, CAPSTANS, SREATSBAR
- AND ARTICLES CONNECTED WITH PRACTICAL SLA-MANSHIP AND THE SAVIND OF LIFE FROM SHIPWBECK. . INFANTAL ARMY-CLOTHING AND ACCOUNTS MENTS.
- G. CAVALAY ARMY-CLOTHING AND ACCOUTREMENTS. H. CAMP EQUIPAGE, SUCH AS MARQUEDS, TENTS, &c.
- I. NAVAL GUNERY, AND WEAPONS OF ATTACK AND DE-TENCE NORE ESPICIALLY ADAPTED TO NAVAL PUR-
- J. ARTILLERY EQUIPMENTS, ROTH IN GARRISON AND THE FIELD, MACHINES FOR MOUNTING AND DISMOCRY-ING ORDNANCE.
- Gerrison Equipments, Field Equipments, Machinery for Mounting, Direcounting, and Trons-porting Ordmance, Carriages, &c.
- ORDNANCE AND PROJECTILES.

K. MISCELLANEOUS.

X.c. Surgical Instruments. A. FOR OPERATIONS ON THE EYE.

Special Instruments for-1. Operation on the Eyelida.

 Fistula Lachrymulis.
 Strabismus. Artificial Pupil.

5. Cataract. By Depression.

By Extraction.
a. Including Elevators in Silver and Ivory,

a, incuming Lievators in curver and Ivery, Fine Bistouries, Trocurs, Caaulia, Styles, Sounds, various Needles, &c. b. Cataract Kaives, Hooks, Capsular Forceps,

B. OPERATION ON THE EAR. Special Instruments for-

1. Exploration of the Anna and Eustachian Paso. Sounds, Catheters, Specultums, &c.

2. The Conveyance of Air or Liquid into the Tym-

2. The Currectance of Air of Liquid into the Tympaule Cavity.

b. Procumptic and other Syringes in Metal,
Glass, and Casuteloue, Sc.

3. The Removal of Foreign Bodies from the Meatus. a. Lavers, Branch Forceps &c.

4. Perforation of, and other Operations on, the Membrana Tampani.
The Conduction of Sour
a. Including all kinds
and Contrivances.

C. OPERATIONS ON THE NOSE - NAME FOR PLANT AND APPROXI

ling all Contrivances for "Tam

tion and Injection of the Antrum-luding Liston's Drills, Antrum Sy

D. OPERATIONS ON THE MOUTH AND PRIARYAX.

Special Instruments for—

1. Hare Lie.

2. Operations on the Teeth (Dental Instruments).

E. OPERATIONS ON THE THORAX AND RESPIRATORY OPERAND.

F. OPERATIONS ON THE ADDOMINAL WALLS AND ALIMENT-

ARY CANAL Special Instruments for-1. Stricture and other morbid states of the Cino-

 Stricture and other morbid states of the Gao-phagus, the removal of Foreign Bodies, &c. a. Including Geophagus Bougies and Pro-bangs in clastic gum and other muterials, Gisuphagotomes, Guillet-foreign, &c.
 The intraduction and withdrawal of Fluids from he introduction and withdrawal of risings tarms. Stomach; the removed of Poison, &c.
a. The Stomach Pump and its appendages,

Enema Syringes, &c. 3. The formation and maintenance of artificial Anna a. Enterotomes, Porte-Satures, &c., by Dupuy-

4. Prolopsus Ani.
a. All kinds of Rectum-Plugs, in metal, clastic

b. Fistule, Fissures, and Vegetations in Ano. dures (on Luke's and Sampson's

6 Hernia lernia.

2. Cutting lostruments for its radical cure.

5. Tristaes and all nrtificial necass of support, arrecutesis Aldoninia.

Tristael squaination of the rectum, ratious Speculums (by Hitton and others).

G. OPERATIONS ON THE GENITO-UNIVARY SYSTEM IN THE

incensing Lithotomes, Gorgets, Staffs, Forceps, Scoops, &c. ithofrity. a. Lithofrites, which disintegrate the Stone by

Perforation,
Ditto ditto by Concentric Pressure,
Ditto ditto by Percussion,
b. Syrioges and other Instruments to inject and

Spiere the Bladder e. Dilators, Sliding-scoops, and Apparatus to remove Calculi impacted in the Frethra; Instruments for Lithertasy, &c.

Instruments for Litmettary, ec.
Printer Fastilia.

a. Including all Frethroplastic Instrume
Verethrotomes, ec., for Recto-Predictal,
rinnest, and Recto-Verent Fastilia.

Stricture, Postatic and Vesical Disease, and 4. Stricture

a. Every variety of Catheter, Bougle Porte-Caustique, and Urinal; Cur-fars for Paneture of the Budder, Pubes, through the Rectum, &c.

ntus employed by Jews. 8, By the

luding Instruments for obliteration of the

Spermane veins (micos or, those for simple support; Supensory and other Bandages; Serotal Rings, &c. ON THE GENITO-URINARY SUSTEM IN THE

Exploration.

a. Including Speculoms In all Materials,

Sounds, Dintors, &c.
2. Operations on the Uterus, Vagina, and Corvex

a. Hysteronomes and Instruments for Paracen-Hysteronomes and anstruments to a more-tecis Uteri (Lisfranc's and Simpson's). Uterine Scissors and dressing Forceps (corved and straight), Porte-Caustiques, &c.

3. Polypus Uteri.
a. Vuicelia and other Forceps, Porte-ligatures,

A. Vuicella and other Forceps, Porte-ligatures, Serre-neuds, &c.
 Prolapsus and Procidentia Uterl.
 a. Including Possaries, Bandages, and artificial support of all Kinds.
 Vesico-Vaginal Fistula and Recto-Vaginal Fis-

a. Hancock's new Instruments, Urinary Receptueles, &c. 6. Obstetrical Purposes. a. Including all Midwifery Instruments, and Contrivances to remedy Lacerated Pe-

rincum, I. OPERATIONS ON THE EXTREMITIES.

Special Instruments for-I. Amputations.

o. Army (portable) and Hospital Cases, &c.
2. The Adjustment of Fractures.
o. Including Splints, Inclined Planes, Pads,
Slings, and Bandages, to all Materials. 3. The Reduction of Dislocations.
c. Pulleys, Rings, Staples, &c.

K. OPERATIONS ON THE OMERCS SESTEM

Special Instruments for—

1. Terpanning.
2. Resection and Exarticulation.
3. The Extraction of Sequestra, &c.

L. OPERATIONS ON THE VASCULAR SYSTEM.

I. Venescetion a. Cupplog Instruments, Lancets, Leech-tubes,

2. The Control of Linmarrhage,

s. Tourniquets, Compressors, Torsion Forceps, &c. 3. Transfusion.

```
4. Aneurism.
     By Ligature: -a. Angurism Nordier, Purtedi-
     gatures, Sampson's Speculum, &c.

By Compression:—6. New Instruments, by
Wyld, Bellingham, and others.
5. Navus.
```

a. Needles, Porte-aiguilles, &c. (Listen's and Brodie s). 6. Varices.

a. including Elastic Bandoges, Stockings, Ankletr, &c.

M. AUTOPLASTIC AND ORTHOP, EDIC OPERATIONS. Special instruments for—

1. The various Taliacolian Processes.

3. Mechanical Compensation of Lost Parts.

Artificial Eyer, Noses, Ears, Colus, Palaies, Teeth, Hands, Arms, Legs, &c.
 Orthopædic Processes.

a. Including all Orthopedio Apparatus, Back and Leg Boards and Irons, Stays, Belts, Supports, Suspenders, Boots, Shoes for the cure of Bunious (Lanagua's).

N. DRESSING INSTRUMENTS. a. Surgeons' Pocket Cases and their usual contents: Spring Distouries, Tenaculums, Scalpels, Scissors, Forceps, Spatilie, Probes and Directors, Needles, Ligature-Sills, &c.

O. MISCELLANEOUS PRILOSOPHICAL APPARATUS APPLIED TO THE INVESTIGATION AND TREATMENT OF DISEASE. a. Microscopes, Englecopes, and Lenses: Urinometers and Thermometers; Volta-electric Apparatus; vaand Thermometers; Volta-electric Apparatus; va-rious illuminating Speculums; lustraments in India-rubber for the application of Intense Coll; glooper's Water Curbions for the reception of fluids of any temperature; spompio-piliuc, Pstent Lint, Plaisters, Collodion, Nipple Shields, Breast-

pumps, &c. P. Surgical Tables, Beds, Mattresses, Chairs, Craoles RESTS, &c.

Q. POST-NORTEM AND DISSECTING INSTRUMENTS, AND IN-STRUMENTS FOR EMBALMMENT.

R. INSTRUMENTS APPLIED TO VETERINARY PURPOSES.

MANUFACTURES. X1. Cotton.

A. Corron Yann and Thurad.
1. Grey Twist in Hanks and Bobbins, from No. 20 White and Bleached Yarn, Dyed Yarn, assorted Colours

2. Cotton Threed—
Two-fold Lace; 2, 3, 4 6, and 9-cord rewings.
Two-fold Liste; kuftlings. Turkey-red and Pink.

Crothel Cottons 3. Crape Yarn

B. CALICOES.

Sheetings (Grey and Blenched)-3 and § Super. Shirtings (Grey and Bloached).

Domestics, Madapollamsand I and 40 meh Printers'.

Long-rioths (Plain and Twilled)lmitation frish.

CORDS AND BEAVERTEENS. 1. 4 cil and 2 Cords.

other meterials, of which the Precious Stones er Metals do not furm the principal feature.

H. Ornaments and Toys worded in Iron, Steel, and other Metals, which are neither Precious Metals nor Biteathous of them, as Chatelainss of Freel, Chains of Steel, Sudia-Hilts, Cet-Stell, Sing and Kyre Bockley, Berlin Iron Ornaments, Changes, Brochaerts, Elmann, Northaces, Brachelts, Feb.

I. ENAMELLING AND DAMASCENE WORK 1. Enamelling of subjects on Gold and Precious Metals.

(Except when shown in the Section of First Aers.)

2. Damsseene Work, or insertion of one Metal in another, not included in the above-named Classes, as furning a minor ingredient in some more im-J. ARTICLES OF USE OR CUSIOSITY NOT INCLUDED IN THE

PREVIOUS ENUMERATION.

2. Sheet.

XXIV .- Glass A. WINDOW GLASS, INCLUDING SHEET GLASS, CROWN GLASS. AND COLOURED SHEET GLASS. 1. Crown.

3. Brown Plate Glass, allvered and unsilvered. 4. Coloured Sheet, Pot Metal, or finahed. 5, Glass Ventilators

6. Glass Shades, round, nval, and square. B. PAINTEO AND OTHER KINDS OF ORNAMENTED WIND 2. Painted and Leaded Windows.

GLAM. 1. Ensmelled, Embossed, Etched, painted white, or coloured Window Glass

C. CAST PLATE GLASS

1. Rough Plate 2. Ground and polished, allvered and unsilvered.
3. Pressed Plate.

4. Rolled Plate, white and coloured.

D. BOTTLE-GLASS. Ordinary Bottle-glass, including Moulded Bottles.
 Medicinal Bottle-glass, including Phials, &c., blown and monlded, of all kiads and shapes.

3. White Bottle-glass. Crown, Pressed, and Moulded

4. Water-pipes and Tubing. E. GLASS FOR CHEMICAL AND PHILOSOPHICAL APPARATUS.

 Glass for Matrass, Retorts, sud other kinds of Chemi-cal and Philosophical Apparatus.
 Water-pipes and Tubing. P. PLINT GLASS OR CRYSTAL, WITH OR WITHOUT LEAD, WHITE, COLOUGED, AND ORNAMENTED FOR TABLE VASIN, ETC.

1. Blown.

Moulded and Pressed.

Cut and Engraved. Cut and Engravei.
Reticulated and spun with a variety of colours, la-crusted, fisshed, enamelled of all colours, opales-cent, imitation of Alabaster, gilt, platinised, sil-

vered, &c.

5. Glass Mosaic, Milleflori, Aventurine, and Venetian Glass Weights, &c. 6. Beads, Imitation Pearls, &c.

 Chandellers, Candlesticks, and all Glass Apparatus for Lamps, Candlesticks, Girandoles, Wall Brackets. with or without drops, &c.

G. OPTICAL GLASS, FLINT AND CROWN. Rough Discs of Flint and Crown, to make Lenses for Telescopes, Microscopes, Daguerrotype and

Calotype Apparatus, &c.

2. Flist and Crown, blown or cast in plates for the Optician.

 Thin Glass for Microscopes.
 Refractive Apparatus, Prismetle Lenses for Lighthouses. (See also Class J.) XXV. Ceramic Manufactures - Porcelain, Earthenware, &c.

A. POSCELAIN, HADD. l. Chinese. 2. Japanese

3. Continental, as Berlin, Meissea, &c. B. STATUARY PORCELAIN.

1. Statuary. 2. Parian. 3. Carrara,

C. TENDER PORCELAIN. English Porcelain, soft or tender,
 French, with Siliclous body.

D. STONEWARE, GLAZED AND UNGLAZED.

3. Coloured body, Jasper "

Coloured body, Jasper "

Reyptian black, unglazed.

Reyptian black, unglazed.

Red "

Red "

Red " Cane.

Drab, 8. Browaware, with sait glaso. (The Lambeth, Chesterfield, and Beauvais manufactures are included in this class.)

9. Chemical utonsils. (These are made both in Stone-

ware and Bard Percelain.)

E. EARTHENWARE I. White body for Printing, Painting, or Enamelling In different Colours.

Common Cream-colour. 3. Green glazed ware. 4. Rockingham 5. Delft ware.

6. Majolica ware. 7. Mocha and Dipped Ware. Common Lend glazed ditto, for utensils. Coloured body, Turquoise.

Drab. Olive.

Cottage brown. F. TERRA COTTA.

 Vases and Garden-pols.
 Crnaments for Architecture.
 Encaustic or Inlaid Tiles. Encaustic or initial street.
 Tensorie of various colours, compressed from pow-

4. Tenserie of various concentration derect clay.
5. Superior Plain Tiles for pavements, ditlo ditto.
6. Bricks, ditto ditto.
7. Roefing Tiles, ditto, ditto.

7. "Roofing 8. Chimney Pipes. 9. Common Bricks. 10. Roofing Tiles, &c.

OBNAMENTED OR DECORATED. 1. Ornsmented on Bisone-

Painted by hand. Printed and transferred in various colours. 2. Ornamented on the place.

Painted by hand. Printed by the press. Printed by hand. Gold Lustre.

Steel Enamelling in various colours. Gilding.

H. PRODUCTIONS FOR ARCHITECTURAL PURPOSES.

XXVI. Decorative Furniture and Upholstery, including Paper-hangings, Paper-maché, and Japanned Goods. A. DECORATION GENERALLY, INCLUDES: ECCLESIASTICAL DECORATION.

Ecclesiastical Decoration generally.
 Ornamental coloured Decoration, as executed by band.
 Imitations of Woods, Marbies, Sc., ditto.
 Relieve Decoration, mechanically produced.

FURNITURE AND UPHOLSTERY.

1. Cabinet Work, plain.
2. Cabinet Work, carved or ornamentel,
3. Marqueteric, inlaid Work, in Woods, &c.
4. Buhl or Metallic inlaid Work. 5. Chairs, Sofas, and Beds, and generally Upholstery.

C. PAPER-HANGINGS Damask Patterns Flower Patterns. Flock and Metal Papers, 4. Decorative Paper-bangings by Block-work

by any other process. 6. Machine-printed Paper-hangings, D. PAPIER-MACHE, JAPANNED GOODS, PEARL AND TORTOISE-

SHELL WORK. Papier-muché, jepanned, inlaid, and decorated.
 Papier-maché (not japanaed), produced in ornamental forms for decoration.
 Japanned Goods in Iron, ée.
 Fear land Tortoisehell Work.

XXVII. Manufactures in Mineral Substances used for Building or Decoration, as in Marble, State, Porphyries, Cements,

Artificial Stones, Se. A. MANUFACTURES IN COMMON STONES.

1. For Building, and constructions not strictly decora-

2. For Decorativa purposes. B, MANUFACTURES IN SLATE. 1. For Construction.

9 For Decoration C. MANUFACTURES IN CRIMENT AND ARTIFICIAL STONE.

- D. MANUTACTURES IN MARRIES, GRANITES, PORPHYRIPS, ALABASTER, SPAR, ETC., FOR USEFUL OR ORNA-MENTAL PERPOSES
- 1. For Construction and external Decoration
 - 2. For internal Decoration (not Furniture), as Chimney-
- S. For articles of Furniture, as Tables, &c 4. For purposes of mere Ornament.
- E. INLAID WORK IN STONE, MARRIE, AND OTHER MINERAL SUBSTANCES. F. ORNAMENTAL WORK IN PLASTER, COMPOSITION, SCAG-
- LIOLA, INITATION MARRIE, &c. G. COMBINATIONS OF IRON AND OTHER METALS WITH GLASS AND OTHER SCHSTANCES FOR VARIOUS USEFUL PUR-
 - 1. For Architectural purposes,
 - 2. For Miscellaneous purposes,
- XXVIII. Manufactures from Animal and Vegetable Substan not being Woren, Felled, or included in other Sections.
- A. MANUFACTURES THOM CASUTCHOUG. I. Impermeable Articles.
 - Holdsworth's Life Preservers. Captain Smith's Life Preservers. Hydrostatic and Air Beds. Water and Air Cushions.
 - Gas Bags. Printers' Blankets.
 - Cloaks, Capes, Coats, Paletots, &c. Boots and Shoes, Over Shoes, or Goloshes. Fishing and Deck Boots.
 - Ship Sheets. Bellows. Air-pump Valves for Steam Engines. Sponge Baths and Bags.
 - Prepared Water and Air proof Textures of every description 2. Elastic Articles Railway and other Carriage Springs and Buffers. Valve Canvas
 - Knee Caps. Surgical Bottles.
 - Surgical Bottles.
 Pump Buckets and Valves.
 Bands and Rings for Letters and Packages.
 Writing Tablets.
 Trouser Straps.
 Gussets for Boots.
 - Vest Backs. Vest Backs.
 Washera for Flange and Socket Joints.
 Driving Bands for Machinery.
 Railway Felt.
 Wheel Tires
 E. Smith's Torsion Springs for Window-blinds and

 - Shades.
 - Stated.

 Doer Nyrings.

 Dr. Belf's Sewer and Sink Valves.
 Hodge's Projectile and Lifting Straps.
 Air-pump Valves.
 Einsto Webbing.
 Cricket Gloves and Balls.
 Stoppers for Decanters, Bottles, Jars, and other
 - Articles in Caontehoue Moulded, Embossed, Co-loured, and Printed.
 - Bas-reliefs. Bags. Maps, printed on Caoutchouc.
 - Sheets, in Colour. Emboused and Printed Ornaments Bracelets, &c., Embossed, Coloured, or
 - Bottles, Embossed and in Colours
- Bottles, Embossed and it country.
 Embossed Sheets for Seats and other Purposes.
 Vilennized Articles combined with Metal such as
 Decanter Stoppers, lukstands, Cocks and Taps
 for Fluids, Hinges, Locks and Boits, Wheel Tires, Plugs for Cisterns, Linings of Vessels, &c.
- B. MANUFACTURES THOM GUTTA PERCHA
 - For Waterpreofing Purposes.
 For Agricultural Uses, as Tubing for Manure, &c.
 For Maritime Purposes, as Spenking Trumpets, Life Buoys, Life Boats, Cords, Tiller Ropes, &c.

- 4. Decorative Uses, as Ornamental Monldings, Brackets, Medallions, Pieture Frames, &c.
- Medallions, Pieure France, &c.

 Sargical, Flectrical, and Chemical Uses, as Dissolved
 Gutin Percha for Wounds, Stethoscopes, Splints,
 Ear Trumpets, &c. Cathoys, Funnels, Acid Yessels,
 Covering of Telegraph Wire, Insulating stooks, &c.
 Domestic and Miscellaneous Uses, as Seles for Shoes,
 Linings of Cisterns, Conveyance of Water and
- Gas, Hearing Apparatus, &c.
- C. MANUFACTURES FROM IVORT, TORTOSESDELL, SHELLS, BONE, HORN, BRISTLES, AND VEGETARLE IVORT. D. GENERAL MANUFACTURES PROM WOOD (not being
 - Furniture). 1. Turnery.
 - 2. Carving, &c. 3. Coopers' Work of all kinds. 4. Basket and Wicker work. 5. Miscellaneous Wood work
- E. MANUFACTURES FROM STRAW, GRASS, AND OTHER SIMILAR MATERIALS.
- F. MISCELLANGOUS MANUFACTURES FROM ANIMAL AND VEGB-TABLE SUBSTANCES.
 - XXIX. Miscellaneous Manufactures and Small Wares.
- A. PERFUMERY AND SOAP. B. ARTICLES FOR PERSONAL USE, AS WRITING DESIGN
 DEESING CASES, WORKROADS, WIEN NOT EXHIBITED IN CONNEXION WITH PRECIOUS METALS
- (XXIII.), AND TRAVELLING GEAR GENERALLY. C. ARTIFICIAL FLOWERS.
- D. CANOLES, AND OTHER MEANS OF GIVING LIGHT E. CONFECTIONARY OF ALL KINDS. F. BEADS AND TOUS, WHEN NOT OF HABOWARE, FANS, ETC. UMBRELLAS, PARASOLS, WALRING-STICES, ETC.
- II. FISHING TACKLE OF ALL RINGS, ARCHERY. GANTS OF ALL RINGS. J. TAXIOERNY.
- K. OTHER MISCELLANEOUS MANUFACTURES.
 - FINE ARTS. (So for as they come within the fourtetions of the Exhibition.)
- XXX. Sculpture, Models, and Plastic Art. A. Sculptune as a Fine Ant.

 1. In Metals simple, as Gold, Sliver, Copper, Iron, Zine,

 - Lend, &c.

 2. In Metals compound, as Bronze, Electrum, &c.

 3. In Minerals simple, as Marble, Stones, Gems, Clay,
- 4. In elaborate Mineral Materials, as Glass, Porce-
- inin, &c.
 5. In Woods and other Vegetable Substances. 6. In Animal Substances, as Ivory, Bone, Shells, Shell Cameos.
- B. Works in Dir-singino, Intactics.
 1. Coins, Medals, and Models of a Medaliic character in any material.
 - 2. Impressions struck from Dies for ornamental purposes.
 3. Geme, either in Cameo or in Intaglio, Sheli Cameos.
 - 4. Scals, &c.
- C. ARCHITECTURAL DECORATIONS.
 1. Integral, In Relief, Colour, &c.
 2. Adventitious, as Stained Glass, Tapestry, &c.
- D. MORAICS AND INLAID WORKS. 4. In Wood. 5. In Metal. 1. In Stone. 2. In Tiles
- 3. In Vitrified Materials. E. ENAMELS
- 1. On Metals. 3. On Glass. 2. On China. F. MATERIALS AND PROCESSES APPLICABLE TO THE PINE ARTS OFSTRALLY, INCLUDING FINE ART PRINTING, PRINTING IN COLOUR, ETC. ETC. 1. Encaustle Painting and Fresco.
 - Encaustle Painting and Freeco.
 Ornamental Printing. Chromo-typography. Gold-Haminated Typography. Typography combined or uncombined with Embossing.
 Lithography. Black. Chromo-lithography. Gold-Illuminated Lithography. Lithography combined or uncombined with Embossing.
 - 4. Zincography, or other modes of Printing.
 - 1. in Architecture. 2. Topography. 3. Anatomy.

LYON PLAYFAIR

APPENDIX B.

INSTRUCTIONS FROM THE COUNCIL OF CHAIRMEN TO THE JURIES.

1. In accordance with the decisions of the Royel Commissioners, the Council of Chairmen have met and agreed to the following Instructions as a guide to the Juries.

2. Working of Juries.—In regard to the working of the Juries, the Council of Chairmen think it advisable to leave Juries, the Council of Chairmen think it advisable to teave much to the discretion and grapular experience of each Jury; but upon the following points the decisions of the Royal Commissioners are precise, and it will be decirable that the practice of the Juries should be uniform.

3. The Juries will, at their first meeting on Monday, consider the course to be followed in the examination of the

autjects coufided to them, and arrange generally the time

end places for their respective meetings.

4. Deputy-Chairmen.—The first duty of each Jury will be to elect a Deputy-Chairman, who will assist the Chairman, and fill his place in the Jury, or at the Council, in his

ansence.

5. Reporters.—A Member of the Jury will be appointed to draw up a Report npon the class of subjects submitted to it. It will be advisable that this appointment abould be made as soon as the eligibility and willingness of some Member. as soon as the cligibility end willingness of some Member to underlike that duty can be ascertained. As the Reports will probably be published, they should be drawu up with the care necessary to describe the State of Industry of all Notions, as shown in this Exhibition, and in such e mourer as may best form a permanent record of the Exhibition itself.

6. Sab-Committee.—The Royal Commissioners have given their senction to Juries ecting in matters of detail by Subtheir searction to Juries exting in matters of detail by Sab-Committees. How far it may be convenient in each case to edopt this system, and to depute to a Sub-Committee, or to Individual Members, the investigation of particulers objects, is left to the judgment of each Jury; but it must be boroe in mind that so Award can be made but by a majority of the Jury.

7. Ecidence and Associates.—Whou e Jory may wish to call lo the sid of persons of technical knowledge to aid their judgment, they may do so in conformity with the 20th Article of the General Decisions.

8. Jurora of another Class, when knowledge of thet Class 8. Jurora of another Class, when knowledge of thet Class is required to guide the Jury, may be called lu If a majority of the Jury should decide to do so, 9. In both the above cases, however, the persons to be consulted do not possess Notes, and only remain ssecciated with the Jury as long as the special occasion for which they

were called requires their presence. 10. Juries to curry on their Juvestigations without delay,The Juries are expected to carry on their luvestigation with

is little intermission, and to come to their decision with as as Hitle intermission, and to come to their decision with as little delay as possible.

11. Mode of moking Acards.—When a Jury has decided upon its Awards, those Awards will be submitted to a Meeting of all the Juries of the same group for confirmation, and for the investigation of any Decisiou that may be

12. The Awards will then be submitted to the Council of Chairmen, to secure uniformity of action, and a compliance with the Rules now laid down, or which may be eafter be sanctioned by the Council.

13. The Awards will become final as soon as the Council of Chairmen shall have reported that they are in conformity

to those Rules. 14. Sorrest.-All the Considerations, Discussions, and Decisions of each Jury and of the Council of Chairmen, are to be considered as strictly confidential, and on no account

to be divulged until the Award has become final.

15. Medals to be awarded without reference to Nationality.

The Medals will be ewarded for excellence only, without reference to countries, the Exhibition heing considered as a whole, and not as consisting of the produce of different nations

16. Individual competition to be avoided.—In making the Awards, the Juries will bear in mind that the Royal Com-misslopers desire that the different Medals should indicate majutenance

different kinds of merit, and not degrees lu the same kind

of merit.

17. Two Medals only to be awarded, - The Juries will only to be awarded. - The Juries will only the small bave to eward the medium size and large Medal. The small Medal will not be given by the Juries, the Commission having withdrawn it as a Prizu Medal at the request of the Council of Chairmen.

Council of Chairmen.

Its, Condition of the enerod of the Models.—The inclums its for at it is proposed to be called the "Print Models" will be a proposed to be called the "Print Models" will be a former of the condition of the

The grounds, on which this recommendation is made etion. must be fully stated. The Great Medal will only he given for very pre-eminent and indisputable merit. It is imfor very pre-eminent and indisputation merit. It is im-possible, until the Juries have acquired a knowledge of the articles oxhibited, to define the proportion of the Great to the Prize Medal; hut the Council of Cheirmen have to announce their intention of making the proportion a very

21. The Chairman of the groups of Prices have had ander 21. The Chairmean of the groups of Friees have had nader their consideration the various conditions which It will be advisable to adopt in the award of Prizes In the various classes into whole the Exhibition Is divided. They do not intend that these conditions should be computiony on the Juries, as it is probable that they may require modification to particular cases, but they may be useful as indications to show the general grounds on which awards may be made. GROUP A.

Medals are to be ewarded for novelty in the mode of ohtaining, applying, and elapting Rew Materials and Pro-duce, skill and excellence in known modes of obtaining, applying, or adapting them; comparative excellence in the quality obtained, combined with utility. The value of the instructiveness of any Scries exhibited. GROUP B.

The Sub-Committee of the Chairman of this Group, for

eertain reasons set forth in their Report (see Report) erriant reasons set form in their nepore (see Report), strongly urge that if novelty of invention (as far as regords Machinery) be not altogether excluded, the greatest caution should be used, and the most jedous scrutiny employed by Jurors before any Prize whatever be awarded under such claims for morit

CLASS V .- Machines for Direct Use. Fitness of the work for the object sought to be obtained (which combines simest every merit of Machinery), econon in first cost, durability, economy of maintenance, excellency of workmanship.

CLASS VA .- Carriages. Successful application of any new Material, with elegance of design and excellence of workmanship, strength and lightness, reasonable cheapuess.
Note.—These qualities will apply almost exclusively to Carriages of luxury.

For the Public Service. Lightness, sufficient solidity for safety, durability, cheap-

CLASS VI .- Manufacturing Machines and Tools. Pitness of the Machinery for the objects rought, economy in the first cost, durability, and excellence of workmanthip; economy in production, and perfection in articles manufactured; saving in time, and quantity produced; economy of Drawing exhibited.

CLASS VII. - Civil Engis vering, Architectural and Building

Contringuese. Science and skill in Design to obtain the object sought with the greatest economy; fitness in the application of Materials, success in the work in which the Model or Draw-

ing is exhibited; perfection of workmanship in the Model or CLASS VIII .- Naval Architecture and Military Engineering; Ordnance, Armour, and Accouteements

Merits of combination in the Models or Drawings rejating to Military or Navai Engineering; advantages obtained by experiments is carrying out the means proposed either by Models or Drawings. Improvements in Arms, Apparatus, or any articles belonging to Military and Naval Service or Architecture, to Rigging or other branches of Seamanship, to Accountements or Equipments of Troops, their fitness and efficacy; economy in production.

lu this Class actual trial has been found generally neces sary for the safe award of Prizes; Field Instruments being tried on the land, and Yard implements being also set to work, and the results exhibited in Numerical Tables.

Class X.—Philosophical Instrument

Novelty of inventions, or novelty in the whole or part of the instruments; ingenuity of construction; new applica-tion of old principles; application of new principles; im-proved beauty of form; increased durability, and more extensive application,

CLASS XA .- Musical Instruments.

Novelty of invention, novel application of old inventions, improvement of mechanical action. Tone, perfection of worksnauship, beauty of design combined with general excollence, increased felicity of action, cheapness combined with darability.

CLASS X B .- Horology.

Ascertained or probable accuracy and certainty of per-formance, whether time-keeping, discharging of striking parts, or registering; stability, strength and durability, simplicity and economy of construction, guodoess of execu-tion. High finish to be considered subordinate to the scientific objects.

CLASS Xc.-Surgicul Instruments

For instruments which possess novelly of a useful charac-ter, and giving evidence of originality and inventive power, ingenuity in the application, catendar, or modification of principles already known, or for a see combinations, mecha-nical skili, including chespness, finish, and other qualities of mechanical execution.

Guour C .- Manufactures. Textile Fabrics. In this, those articles will be rewarded which fulfil in the

bighest degree the conditions specified in the sectional list, namely, increased usefulness, such as permanency in dyes, improved forms and arrangements in articles of utility, &c.; superior quality, or superior skill in workmanship; new use of known materials; use of new materials; new combi-nations of materials; beauty of design in form or colour, or both, with reference to utility; cheapacse relatively to excellence of production.

GROUP D .- Metallie, Vitreous, and Ceramic Monufacture. Important inventions and discoveries, or regularity com-bined with excellence of design; novel application of known discoveries; great utility combined with economy and beauty; excellence of workmanship and quality.

Guot P E .- Miscellanspus Novelty of material in application, excellency of design, material, workmanship, and cheapness. GROUP F .- Fine Arts.

Originality and excellence of design and importance of the work, combined with great merit of execution; merit in execution, combined with application to useful purposes.

APPENDIX C.

MINUTE OF ROYAL COMMISSION ON THE AWARD OF THE COUNCIL MEDAL.

"Wirm reference to the awards of the Council Medal, the Commissioners think it proper to recapitulate the terms of those Decisions, and to explain with somewhat greater minuteness the exact meaning which they intended to attach

"The 107th of the published Decisions of the Commispioners is as follows :

- sloaers is as follows:—

 "It is the intention of the Commissioners to reward

 "casellence in whatever form it is pre-worded, and not to
 "give Induscements to the distinctions of a merely indi"distinction of the distinctions of a merely indi"without competition. Although the Commissioners have
 "without our parties of the present the commissioners have
 becoming on having three Media's of different sizes
- at determined on having three Nessas of concrett sucresses and designs, they do not propose to iostruct the Juries to a ward time as first, second, and third in degree for the same class of subjects. They do so twish to transmet the same class of subjects. They do so twish to transmet the sucresses of subjects that the duries will rather view the three kinds of the subject in the subject is the subject to the subject in the subject is the subject to the subject in the subject is subject to the subject in the subject in the subject is subject.
- " Melais as a means of appreciating and distinguishing to the respective characters of the subjects to be rewarded,
- 44 and not of making distinctive marks in the same
- "And the 21st Article of the Decisions regarding Juries
- 44 The three classes of Medais are intended to distinguish " the respective characters of subjects, and not as first, second, and third in degree for the same class of subjects."
- **second, and third in degree for the same class of subjects.
 ** The important features in these Decisions, and that which distinguishes the mode of granting Medals on the present occasion from that usually adopted in the Exhibitions present occasion from this unusity resource in the free medials of Foreign Countries, is the assouncement that the Medials are not to be awarded as first, second, or third in degree for the same class of subjects. It is obvious, therefore, for the same case of subjects. It is obvious, therefore, that in the case of manufactured Articles mere excellence that in the case or monitalization arraces mere accuracy of Manufacture, it may sumstance suppre use it is not understood and the control of the control of

any novelty of invention or adaptation, or any peculiarity in the mode of manufacture, which can also be taken into account, and of which the importance and value shall be judged sufficient, the Council Medal may properly be given.

'thus, for example, if a piece of Liaen be exhibited of such remarkable excellence as to be at once and by such remarkable excellence as to be at once and my unanimous consent recognized as greatly superior to any other piece of Linea in the whole Exhibition, yet if the control of the such as the such as the such as the control, and if it is not described, and if it is not described. The control of the such as the control of the such as the control of the such as the s

Lines of very devided excellence should be produced by a new method, cabbiding orderanges on bilither statistics, it would be quite within the prior of the Decision is question. "I or gain, it a smanyle of Super of carcinolizary finences should be exhibited, if such faceses were the result only of the application of the ordinary processes, with more than the application of the ordinary processes, with more than Medal; but if a new chemical agent, or a new process had been employed with advantage in its production, the process by which it was produced, if sufficiently important, "It is soft, however, indeeded to limit the creating of the

"It is not, however, intended to limit the granting of the Council Medal to cases of production by a new process: such a rule would, of course, not apply where the question of Fine Art was invelved. In jindging of works of pure art, the Medal will, of course, be given to those cases where the most remarkable and pre-eminent genius has been displayed; and in cases where design is applied to an article of Manufacture, it may sometimes happen that it will be of for the mere excellence of the workmanship, might properly receive it for a very extraordinary and original merit of the design applied to them. And, in like manner, though a Council Medal ought not to be given to a piece of Furniture, of which the principal merit was that it was well made, it might be awarded to it if there were so much beauty in the

design as to entitle it to great distinction as a Work of Art,
"The Commissioners must, however, limit themselves by observing that they would not recognise beauty of design as a sufficient title to a Council Medul unless applied to a object of some importance. Very great merit might be found in the carving of an umbrella or a pipe, yet it might be thought improper to reward such merit with a Council Medal, on account of the comparative insignificance of the

subject. "The last observation naturally leads the Commissioners." The last observation naturally leads the Commissioners. "The last observation of the last foods and the last leads to the last leads to make the last leads to the preparation of an Article for exhibition should entitle him to a report of an Article for exhibition should entitle him to a commission of an Article for exhibition should entitle him to the prediction of valuable laws, products, of specimens of Manafactured Goods remarkable only for the size of the specimens, of very precious Jewick, products, of specimens of the preductions of the productions of the productions of the productions. precious Jewes, or of collections of the productions of particular districts. In these cases, the Commissioners are decidedly of opinion that the mere fact of a large outlay of money ought not to be regarded as entiting an Exhibitor to receive a Council Media, though care should, of course, be taken, that his zealous co-operation in promoting the objects of the Exhibition, be properly noticed in the Report of the

Jury of his Class. Jury of his Class.

"In the foregoing remarks, the Commissioners have repeatedly spoken of rewarding inventions and new processes. They think it right, therefore, to guard themselves against being supposed to throw upon the Juries the duty of discovering whether each particular object which

claiming the merit of it. They can conceive that, in many claiming the merit of it. They can conceive that, in many cases, such as investigation would, under the electronsumers, he impossible. In Michinery, particularly, they pressume that the Juries will reward an important Machine without undertaking to pronounce whether this moveline exhibited in lit construction have been originated by the Exhibitor, or have been borrowed or adapted by him from some one else. The test of Invention will be attisfied if the Machine be rewarded for its importance and ingenuity, and not for the mere excellence of workmanablp. "As the Commissioners have referred to the claims of

invention, it would appear to be desirable to fix some data beyond which invention should cease to be a claim for the Council Medal. It has not been made a condition lu the Council Medal. It has not been made a condition in the admission of Articles to the Exhibition that they should be new; but it would be obviously difficult and inexpedient new; but it would be obviously difficult and inexpedient properties of the control of the invention should not be admitted.

larcention should not be admitted.
"In communicating these remarks to the Council of Chairmen, the Royal Commissioners must again report that property of the council of the Chairmen, the Royal Commissioners must again report that probabled Decisions being misunderstood. The responsibility of giving effect to those Decisions must rest with the Council to Chairmen, in whom the control of the separate Juries, and more particularly the duty of regulating the distribution of the Council Media, has been regulating the distribution of the Council Medal, has been specially rested; and the Royal Commissioners would strougly Impress apon them the responsibility under which they lie of exercising that control with care and firmness, according to the opinions which they may per-sonally entertain of the merits of the several cause hought they mark for reward is netually the invention of the party | before them."

ANSWER OF HIS ROYAL HIGHNESS PRINCE ALBERT

TO LORD CANNING'S REPORT.

My Long.

THE Royal Commissioners are much indebted to your Lordship, and to the distinguished gentlemen of this and other nations, who have acted on the Juries intrusted with the award of the Prizes in the recent Exhibition, for the zeal with which they have undertaken, and the ability with which they have fulfilled, the task which has been allotted to them. The Commissioners are sensible that the services of these gentlemen have, in many instances, been rendered at great inconvenience to themselves, and at the sacrifice of very valuable time, and of important avocations. It is with pride and pleasure, that they have noticed in the lists of those who have performed this service to the Exhibition, the names of men of every nation of the most exalted rank, and of the most eminent reputations in statesmanship, in science, in literature, in mannfactures, in commerce, and in the fine arts; of men in every respect well calculated not only to form a correct technical jadgment upon the merits of the articles submitted to their inspection, but also to maintain the high character which the Commissioners have uniformly striven to impart to the Exhibition.

In no department of the vast undertaking, which has just been brought to a happy close, were greater difficulties to have been apprehended than in that in which your Lordship and your eminent Colleagues have given your assistance. On this, the first occasion on which the productions of the different nations of the globe have ever been brought together for the purpose of comparing their several merits, not only were prejudices and jealousies to have been expected to interfere with the decisions, but the nature of the case presented many difficulties of a formidable character, to the formation of a judgment which should appear satisfactory to all. The names of the Jurors, indeed, when once made known, were of themselves a sufficient guarantee for that impartiality which was essential to the fulfilment of their task; and from all that has come to the knowledge of the Royal Commissioners during the progress of their labours, they are fully satisfied that every award has been made with the most careful consideration, after the most ample and laborious investigation, and upon grounds most strictly honourable, just, and candid.

But although the high character of the Jurors would have fully justified the Commissioners in intrusting them with the award of the prizes without fettering their diserction with any instructions whatever, had nothing more than an impartial decision been required, there were difficulties of a very peculiar nature inherent to the task, which seemed to render necessary the adoption of some regulations that might, at first sight, appear to have been somewhat arbitrary in their character. The differences teristics, it would seem to be almost impossible for those who have been in the habit of judging the productions of their own country by one standard, to enter fully into merits which can only be properly appreciated by another standard, since the very points which in the one case appear to be excellencies, may in the other, not unnaturally, betaken as defects. This consideration and a knowledge of the evils which were to be apprehended from any areidentally erroneous decision, in a matter so intimately connected with the commercial interests of every nation, induced the Royal Commissioners to lay down, for the guidance of the Juries, those principles to which your Lordship has referred.

It would, perhaps, have been more interesting to the public had the Commissioners instructed the Juries to follow the practice which has usually prevailed in the Exhibitions of individual nations, and to grant Medals of different degrees, to mark the gradations of excellence among the Exhibitors; but they feel that they have adopted the safer course, and that which was upon the whole most in accordance with the feelings of the majority of the Exhibitors, in directing that no distinction should be made between their merits, if their productions came up to the standard requisite to entitle them to a Prize, but that all should, without exception, take the same rank and receive the same Medal.

The Commissioners, however, considered it right to place at the disposal of the Council of Chairmen a peculiar or "Conneil" Medal, in the cases to which your Lordship has referred. Important discoveries in many branches of science and of manufactures bave in this Exhibition been brought under the notice of the public; and it seems just that those who have rendered services of this kind to the world, should receive a special mark of acknowledgment on an occasion which has rendered so conspicuous the advantages which the many have derived from the dis-

coveries of the few. The grant of the Council Medal for beauty of design, and for excellence in the fine arts, as applied to manufactures, though made upon a somewhat different principle, is also compatible with the views of the Commissioners, since in the cases in which it has been given it does not mark any greater comparative excellence of manufacture or assign to one producer a higher place than is accorded to others, but is to be regarded as a testimony to the genius which can clothe the articles required for the use of daily life with beauty that can please the eye, and instruct and elevate the mind. Valuable as this Exhibition has proved in many respects, it appears to the Commissioners that there is no direction in which its effects will be more sensibly and immediately perceived than in the improvement in the wants of various nations baving necessarily im- which it may be expected to produce in taste, and the pressed their several manufactures with different charac- impulse it has given to the arts of design; and a special

ncknowledgment is justly due to those who have afforded the best examples of art, whether pure or applied, and led the way in this interesting career of improvement.

It was remains for the Commissioners occe more to return to your Leading and your Colleges their confial thanks; and they must not unit to include in these ways assisted you in your blooms, particularly those who have seted with you as Associate or Experts, for the primition and pread have been as the configuration of the three controls of the configuration of the commission and pread have deep dispertices markets; and the Commission are well aware that these gentlemes have frequently been of the greatest service. In the loop frequently been of the greatest service, in the loop frequently been of the greatest service. In the loop frequently been of the greatest service, in the loop frequently been of the greatest service. In the loop frequently been of the greatest service, in the loop for the commission of the properties of the commission of the properties received.

It is the intention of the Commissioners to publish on only the masses of these to whom the Jurice have not only the masses of these to whom the Jurice have been considered in the Jurice have prepared on the state of release, set, and assuming the contraction of the Jurice has been prepared on the state of release, and as desired, in the contract of the Jurice has been prepared to the real and desired disjoined by the contract of the Jurice is not the set of Exporters to the Jurice is not the third to the contract of the Jurice is not the property of the Jurice is not t

It now becomes my pleasing duty on behalf of the Blogal Commissioners, to deliver my most sincere acknowledgements and thanks for the hearty co-operation and support which the Eakhlition has constantly received from Foreign Countries. The Foreign Commissioners, who have left their own constructs to superlinted the limitartical of their transport and the superline of the Eachholton, have ever the constant of the Commissioners of the Countries of the transport of the Countries of the date of the Countries of th

To the Society of Arts, which, by its exhibition of works of national industry prepared the way for this international Exhibition, the Boyal Commission and the public feet their acknowledgments are especially dae, and the Commission have to thank that body for having carried out her preliminary arrangements to an extent which justified me, as their President, in the application which I made to the Crown for the issue of a Royal Commission.

The Commission have also to acknowledge the valuable services afforded by the emineut scientific and professional men wha, on the Sectional Committees, aided most materially in founding a scientific basis on which to rear the Exhibitor.

To the Local Commissioners and members of Local Committees, but more especially to those who have undertaken the onerous duties of Secretaries, our best acknowledgments are also due. Without their zealous aid it would have been impossible to have obtained an efficient representation of the industrial products of their respective localities. And finally, we cannot forget that all the labours of those thus officially connected with the Exhibition would have been in vain, had it not been for the hearty goodwill and assistance of the whole body of Exhibitors, both Foreign and British. The zeal which they have displayed in affording a worthy illustration of the state of the industry of the nations to which they belong, can only be equalled by the successful efforts of their industrial skill. The Commission have always had support and encouragement from them during the progress of the undertaking, and they cannot forget how cheerfully they submitted to regulations essential for their general good, although sometimes producing personal inconvenience to themselves. If the Exhibition be successful in aiding the healthy progress of manufactures, we trust that their efforts will meet with a due reward.

In now taking leave of all those who have so materially aided us in their respective characters of Jurors and Associates, Foreign and Local Commissioners, Members and Secretaries of Local and Sectional Committees, Members of the Society of Arts, and Exhibitors, I cannot refrain from remarking with heartfelt pleasure, the singular harmony which has prevailed amongst the eminent men representing so many national interests-a harmony which cannot end with the event which produced it. Let us receive it as an auspicious omen for the future; and while we return our humble and hearty thanks to Almighty God for the blessing He has vouchsafed to our labours, let us all earnestly pray that that Divine Providence which has so benignantly watched over and shielded this illustration of Nature's productions, conceived by human intellect, and fashioned by human skill, may still protect us, and may grant that the interchange of knowledge, resulting from the meeting of enlightened people in friendly rivalry, may be dispersed for and wide over distant lands; and thus, by showing our mutual dependence upon each other, be a happy means of promoting unity among nations, and prace and goodwill among the various races of mankind.

ALBERT.

LIST OF JURY AWARDS.

GENERAL COUNCIL MEDALS.

HIS ROYAL HIGHNESS PRINCE ALBERT .	٠		For the original conception and successful prosecution of the idea of the Great Exhibition of 1831, Joint Medal with that granted for the Model Ledging House in Class VII.
CHAMBER OF COMMERCE, LYONS	-	٠	For the Collection which it exhibits, in which is shown the general progress made through their exertions in the Silk Manufactures of Lyons.
EAST INDIA COMPANY, THE HONOURABLE		٠.	For the very valuable and extensive collection illustrating the Natural Resources and Manufactures of India.
EGYPT, H.H. THE VICEROY OF			For the very valuable and extensive collection, sillustrating the Manufactures and Natural Resources of Egypt.
FRENCH MINISTER OF WAR			For the part taken by him in exhibiting the valuable collection of Haw Products from Algeria.
SPAIN, THE GOVERNMENT OF		٠	For the valuable and extensive collection of Raw Products, showing the Natural Resources of Spain.
TUNE, THE BET OF			For the very valuable and extensive collection illustrating the Manufactures and Natural Resources of Tunis.
TURRRY, THE GOVERNMENT OF			For the valuable and extensive collection of Raw Products, showing the Natural Resources of Turkey.

GARRIEL KAMENSKY, Russia; Councillor of the Administration of Finances. (Juror in Class XXV.)

power of man, emnot be satisfactorily represented in an Universal Exhibition.

Its products possess immense ntility, and yet offer hat little brilliancy of appearance. Deprived of all that gratifies the eye by elegance of form and varieties of eolour, they can scarcely neutralize these disadvantages and arrest attention, unless by research into their peculiar conditions, their singular and strange forms, and their colossal dimensions, which excite surprise from the great difficulties overcome an their preparation. But such sources of interest are essentially fugitive, and generally harren of result, and the interest thus excited is no adequate reward for the labour, care, and expense that have been incurred in producing them, and they rarely introduce new ontlets for the industry which has been displayed in forwarding them.

These difficulties are inherent. An exhibition, m over, of metalliferous minerals cannot afford, as is the case with agricultural and manufactoring products, a complete comprehension of the ingenious and powerful methods which have either obtained or simplified their extraction, or the multiplied labours by which they have been procured. Agriculture ameliorates and increases the products of

the earth : the skill of the weaver is shown in the beanty of his fabrics, and it is easy for the observer, however inexperienced, to render an account of it, either to him-self or to the public. For minerals, on the contrary, an attentive and prolonged examination often only affords a somewhat incorrect idea of their real value, and of the advantages which may arise from their 'exploitation.' The beanty of the specimens is often only a deceitful guide.

If it be true that the importance and commercial value of an "exploitation" depend upon the riches of the raw material, and the facility of its extraction, it is only in the works themselves, or in the mine, that this double codition of its value can with any certainty be appreciated.

Certain mines of copper afford a good illustration of

• We may refer to specimens of lead ore consisting of cubes nearly 3 feet across, and blocks and obelicks of granite more than 40 feet high. Messrs, Bagnall and Jesson (23, pp. 13-117), exhibit a sectional column of the South Staffordshire thick coal nearly 40 feet high, showing the whole thickness of the seam.

Tux miscral kingdom, which play so important a part in this fact. Most of the specimens obtained from those modern industry, furnishing row materials for our raman—miner yield as much as 60 per cent, aft metal; but still they factores and tools for our works, and supplying fuel for our are not worked to profit, owing to the small quantity of straum-againes, the invention of which has accetupled the three or regularly distributed through reins of which the greater part is barren,

The mines of Cornwall, on the contrary, the ores of which afford only about 8 per cent, of metal, even after dressing, are very profitable to the adventurers.

The abundance of these ores is so great, that they

furnish nearly two-thirds of all the copper obtained from the mines of the whole world

These remarks appear useful at the commensement of this Report, as explanatory of the numerous omissions which have to be regretted in the Great Exhibition, in reference to the products of the mineral kingdom, out easting blame on the great establishments of Europe, and elsewhere, which have rendered themselves remarkable by their absence, they constitute the best enlogium of those who have had the courage to sacrifice all personal considerations to the honour of the industry they re-present. Without expecting any considerable benefit, without any prospect of opening new markets, they have been, nevertheless, desirons of offering their disinterested tribute, and of adding to the effect of an event which will form an epoch in the history of the industry and civilization of the world,

The exhibition of the various productions of the mineral kingdom presented in the Crystal Palace is therefore very incomplete. Saxony and the Hartz, those eradles of mining, which for so long alone in Enrope enjoyed the honour of possessing mining schools, have sent none of their products. Sweden and Norway, likewise very righ in mines, are chiefly represented by magnificent specimens of native silver, as remarkable for their dimensions as for the heanty of their erystallization.

Spain, which supplies so large an amount of mercury to the whole world, and of which the lead mines were once sufficiently important, in the ahundance and richness of the ore, to govern the markets of Europe, has only sent a few detached specimens, so that the exhibition from this ountry gives no evidence of the mineral wealth of the Peninsula. The Jury have thus been unable to award to

* These specimens (exhibited as No. 34, Sweden) are 34 in number, and we have particularly noticed smongst them, viz.:—1. A specimen weighing two ounces, having very distinct and well-formed cubical crystals, 2. One in cube-ociahedral crystals, weighing 67 ounces.

3. One in ortahedrone, weighing 48 ounces: 8 ml 4, one weighing at least 10 libs. composed of large twisted fibres.

[CLASS I.

the Spanish exhibitors more than a single Prize Medal and a few Honourahle Mentions. Even these have been given for the manufacture of iron and steel, and the working of marble,—classes of industry which are but of secondary importance in that kingdom

We ought here to remark, that the prices have been awarded entirely on the examination of the object exhibited. They do not, therefore, in any way represent the theorem of the control of the control of the control of the theorem of the entirely developed the control of the control tent, and often induced give no indication of the real importance of the establishments to which they have been may discover with regard to works with which he is himoff acquainted, are the result of this necessary condition cannot have a personal knowledge of the establishment whose products they cannot a sorted or the establishment whose products they cannot a control of the establishment whose products they cannot a control of the establishment whose products they cannot a control of the establishment of the control of the control of the control of the control whose products they cannot a control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the control of the state of the control of the control of the control of the control of the state of the control of the control of the control of the control of the state of the control of the

Several of the numerous copper-works of Russia, and also the pold washings of that vate empire, perhaps as irch as those which now strong attention in Cullibrata, and the company of the company of the company of the objects early Rysian, Identing its of the Class, consist of specimens of pg, how, and rolled from from the fingerial case, and the company of the company of the company or many of the company where they are forwarded, and permit a companion of the company of the company

The mineral industry of Austria, Belgium, France, and of Germany within the Zultvervin, or Customs' leading, although very imperfectly represented in the Exhibition, includes objects of the greatest interest. Each of these countries has obtained the Council Medal, and a considerable number of Prize Medals.

The Exhibition of Crust Britain in infliciently complete in those objects that have reference in the prediction of in those objects that have reference in the prediction of representing these important branches of industry, intending in most cases be over of iron, and deep predects called in the contract of the contract of the contract accompanied by models of the firstness in which the next in reduct. The research is a simple of the contract of the contract in reduct. The research is a simple of the contract of the contract in reduct. The research is a simple of the contract of the projection of all strates of from one verded in Great Infotuits. The study of this collection is equally interesting the contract of the collection is equally interesting the formation of the collection is equally interesting the contract of the collection is equally interesting the contract of the collection is equally interesting the collection of the collection of

Notwithstanding the omissions so much to be regretted, and which we have just alladed to, the exhibition of objects in this Class still possesses the greatest interest, and is in the highest degree instructive; and it results from it, on a careful investigation, that in all parts of the world, in Europe, as well as America, the mineral has everywhere followed the development of other industries, The difference of price of the raw material, or, to speak more accurately, the abundance of fuel, and its more or less favourable distribution, regulate in each country the cost of manufacture, although it is chiefly with regard to smelting operations and the working of iron that this influence shows itself on the largest scale. The methods of working are everywhere acquiring a certain uniformity of system, the old processes, where buman lubour was so largely introduced, being replaced by modern contrivances which diminish the amount of manipulation and the general expense. The only remark that one can venture to make is, that wherever fuel is ahundant it is more wastefully used; and that the countries where smelting operations and iron are the dearest, are perhaps, on the greatest extent, and where the work has really attained the greatest perfection.

The Royal Commission which presided over the Exhi-

The Royal Commission which presided over the Exhibition had the happy idea of including geological maps

among the objects which ought to appear in it, as one of the most useful means of advancing mineral industry. Many of these maps have been distinguished by the Jury, and will be honourably noticed in the summary descrip-tion of objects that have obtained rewards. The most tion of objects that have obtained rewards, important of all, however, that of England, prepared under the superintendence of Sir HENRY T. DE LA BECHE. Director-General of the Geological Surveys, could not receive any award in this class, that gentleman being the Chairman of the Jury; and it is, therefore, necessary to it in this short preliminary sketch of the ensemble speak of of the Exhibition. It is executed on the Ordnance man prepared and published by Government. The scale of this map (1 inch to a mile, or 1 in 63,360) is sufficient to represent in detail the ontline or the boundary of all the geological formations, and it even allows the direction of the principal metalliferous and other veins to be indicated when they are known for any distance. This great work, at present the only one of its kind, is a model which we may hope will be imitated by the principal Governments on the Continent. Science may then, within a limited time, be enriched by a complete geological map of the whole of Europe. It is true that France already possesses a geological map, which I may be allowed also to eite; and there are also a number of departmental geological maps, many of which are executed with great talent; but these are not all on the same scale, and the details are not of the same kind, so that there are certain discrepancies which prevent our being able to unite them all in a single sheet, and thus form a complete result. The new map of France, which is in no respect inferior to the Ordnance map of England, either in accuracy or execution, furnishes the groundwork for nishes the groundwork for a geological map equal to that which has been prepared by Sir H. De la Beche and the officers of the Geological Survey. England, which laid the first foundation of the true study of stratified deposits by the sections of W. Smith, and the important map of Mr. Greenough, has still the honour of giving to the world a model for the execution of a detailed geological map, applicable at once to industrial researches and agrieultural improvement,

Before commencing the detailed description of objects which have obtained Medial or Hosoumble Mention, we feel bound to mention also the interesting collection from Cannda, promeral by Mr. Leava type 568–681), Director Cannda, promeral by Mr. Leava type 568–681), Director operations of working these over, exhibited by Mr. Reman Tarkov, Mineral Surveyor of the Dueby of Conwall. geological map, which will, we hope, be very soon published.

The model, showing the mechanical preparation of copper ores, of which Mr. Taylor is the exhibitor (434, p. 161), presents remarkable differences when compared with

the incthods generally employed in Cornish mines. The method is mure especially intended for the poorest cores, called Holeans, and admits of a larger proportion of the copper being obtained than is the case with any other methods now in use. The Jury have considered that they are not justified in

The Jury have considered that they are not justified in adjudging any reward to those who have exhibited objects of Nutural History, unless these have been obtained by special researches on the part of the exhibitor. In consequence of this decision, isolated minerals and

geological specimens not connected with distinct operations have been excluded from competition; but we consider that it will be useful to science if we append, as a note to the above general resume, a notice of such specimens as are extraordinary for their dimensions or for the perfection of their forms.

Amonget such specimens must be mentioned, as of the first class in point of interest, a magnificent crystal of emerald, the property of the Duke of DEVOASSHIPE (14, p. 122), obtained from New Granada. It is a regular spisaided prism, perfectly well formed. Two of the parallel faces are more developed than the others, so that the hex-

3

agound base of the crystal has one side larger than the rest. The dimensions of the bose are 2.76 inches by 1.97 inch, and the height of the prism 0·165 inch. Notwithstanding these dimensions, almost gipmide for this kind of micerial, this emerald, which is of a fine green colour, is perfectly clear in the upper part. The lower part, which is attached to the rock, presents many flaws, probably the result of a blow by which it was detached from the vietaked round.

The Dake of Devoushire is also the exhibitor of two crystals of quart, attached by one of the vertical faces, the crystals being each of them 2½ for high by 8 inches in diameter. The pyramidal summittee of these crystals, which rise ocarly a foot above the pin, are completely transparent, but the prisma are cloudy. These magniflecent crystals were obtained from the Alps, lawing been discoted in the control of the control

ON THE PRIZES AWARDED AND THE MOTIVES BY WHICH THE JURY HAVE BEEN INFLUENCED.

The examination of all the objects relative to mines quarries, and metallurgical operations, and the collection of mineral products exhibited in the Crystal Palace, was carried on simultaneously by different members of the Jury. To give greater authority to their decisions, they obtained the assistance occasionally of persons whose special knowledge might assist them. This assistance they availed themselves of, especially with regard to the various specience of iron for the determination of which, they called in four qualified persons, whose practical persons are sufficient to the contract of the contract appreciation. After this circumstantial examination, the Jury divided the list of those whom they consider worthy of revard into three classes; the revards being as fel-

1008:—
1. COUNCIL MEDIALS, for such objects as, according to the terms originally decided on, exhibit either novelty in the mode of obtaining or applying raw materials and produce, or skill and excellence in known modes of obtaining, applying, or adapting them.
2. PRIES MEDIALS for consumntive excellence in the

2. Pairs Media for comparative excellence in the quality obtained, combined with utility.

3. Hoxourable Mention of those objects which, without attaining the superiority required for the Prize

Medal, offer notwithstanding, great merit of execution or the application of new and ingenions methods still requiring the sanction of long experience.

This hast class has been divided into two; but it would be difficult to define very assembled the difference bediener by the difference bediener by the difference bediener by the difference between the control of the difference between the difference bediener by the difference bediener by the difference bediener by the difference bediener bedi

MANUFACTURE OF BLACK-LEAD PENCILS BY MR. W., BROCKEDON, (65, p. 128.)

Drawing peneils of the first quality, known in com-merce as "Brookman's," are made with small prisms sawn from pure massive graphite, and placed in grooves in wood. Pieces of graphite sufficiently large to be thus used are very rare, and the mine of Borrowdale, in Cumberiand, whence they have been obtained, is almost en-tirely exhausted. Mr. Brockedon was long occupied in seeking for some method which might enable him to employ the powder of pure graphite without cementing it by any sobstance, which inevitably injures the quality. He endeavoured to reader the powder enherent by sub-mitting it to coormous pressure; but the different machines and apparatus he at first made use of for this purpose, however strongly they were made, were broken under the pressure, and his endeavours were thus unsuccessful, until the happy idea suggested itself of operating in a vacuum. But it was extremely difficult, if not impossible, vacuum. But it was extremely amount, in no impossible to introduce under the receiver of an air-pump au apparatus for compressing the powder of graphite. Mr. Brockedon overcame this difficulty by no arrangement as simple as it is easily executed, for after having comported the graphite powder by mederate pressure, and thus re-doced it to a certain size, he euclosed it in very thin paper, glued over the whole surface. He then piereed it in one place with a small round hole, permitting the escape of the air from within, when the block thus prepared was placed under an exhausted receiver, and the air having been removed, the orifice was closed with a small piece of paper, and in this state it was found that it might be left for 24 hours without injury. Being submitted theo to a regulated pressure once more, the different particles became agglomerated, and a block of artificial graphite was produced by simple pressure, as

solid as the specimens obtained from the mine. From such blocks the exhibitor was able easily to obtain small prisms for use, which have yielded pencils equal in quality to those manufactured from the purest specimens from Borrowdale

The objects exhibited by Mr. Brockedon are as follows, viz. :-

Specimens of graphite from Cumberland, India, Greenland, Spain, Bobcusia, and several other localities.

 Compressed powdered graphite.
 The same powder in the form of artificial blocks, prepared to the manner just explained. 4. The graphite in small solid cylinders for Mordan's pencil-cases, and other specimens of pencils for various purposes, especially for drawing,

METHOD ADOPTED OF MR. II. L. PATTINSON, OF NEW-CASTLE-ON-TYNE, FOR SEPARATING SILVER FROM LEAD,

(480, p. 165,) Most of the ores of lead contain a small proportion of silver, which may be obtained from them by capellation. This operation consists in oxidising the lead, and transforming it into litharge, during which the silver collects in the bed of the capel, and remains unaltered; but it costs so much in fuel, labour, and loss of lead, that it can only be applied economically when the lead contains at least 20 ounces of silver to the toa. By means of Mr. Pattinson's method, lead containing only 3 ounces of silver to the ton may be capelled with profit. This important discovery in metallurgy, which dates back as far as 15 years, has been adopted during that period in va-rious lead-works in England, and within the last three or foar years has been introduced into France, Spain, and Prussia: it has, therefore, the sanction of experience, and its application has enabled some lead mines to be worked to profit which must otherwise have been negleeted. The method is founded on the property which bodies possess to separate from each other during erystallization, and become to a certain extent pure by its intervention. It consists in fusing the argentiferous lead in a large vessel, and when the fusion is complete, arrangin a large vesser, and when the russo is complete, grang-ing the temperature to the point, so that the crystaliza-tion of pure lead commences. The crystals of pure lead are then removed as soon as they are formed by a large iron ladle pierced with holes, and the silver is concen-trated in a smaller portion of lead, becoming gradually more and more rich, mutil it is by successive operations brought to such a state that its further separation can be made with greatest advantage by cupellation.

The objects exhibited by Mr. Pattinson to illustrate the

include-1. A drawing, representing the whole of an establish-

ment where the work is carried on. There are here seven adjacent pots, heated by the same furnace, in which the lend is brought to contain, by degrees, 14, 24, 5, 10, 20, 40, and even 70 to 75 ounces of silver per ton 2. A large cake of silver obtained by cupellation from the curiched lead.

MANUFACTURE OF FINE SHEET-IRON, CALLED IRON PAPER. FROM THE WORKS OF THE BARON VON KLEIST, AT NEUDECK IN BOHEMIA. (Austria, 424, p. 1031.)

The Bason von Kleist has exhibited a series illustrating the various states of iron manufactured in bis works at Neudeck in Boliemia. It consists of iron ores. ig-iron, and several specimens of irou io bar and in

sheet, and tin-plate, These products are all of excellent quality, hat that

which has chiefly attracted the attention of the Jury, and even of those who are most technically familiar with iron, is a particular kind of sheet-iron meationed in the Cata-logue as "Iron-paper," a name completely justified by the specimens. It is remarkable for its extreme thinaess, flexibility, and strength, and is entirely without flaws,

According to Professor Tunner, the Austrian Member of the Jury, this material is used for making buttons, but it is equally applicable for any abjects that are stamped. It takes a high polish after being worked.

This sheet-iron, of which the method of manofac-

ture is not known to the Jury, but which is altogether peculiar from its beauty, is an ordinary object of commerce.

PRODUCTS OF THE MINES AND MANUFACTURES OF ZINC. EXHIBITED BY THE VIEILLE MONTAGNE COMPANY.

(Belgium, 26, p. 1152.)

Thirty years ago, the uses to which xioe was applied were very limited, and the operations of the Vicille Montagne Company have greatly assisted in extending them by the nunerous applications of the metal which they have introduced: the earliest and most important of these resulted from a sub-do of rolling sheet zinc, which at first presented conductable difficulties. Within this period the works of the Company have continued at the bend of the same branch of zinc industry, having introduced successively into commerce, very flexible and thin sbeets, zinc stamped for a variety of uses, mouldings manufactured by drawing, nails and spikes of various kinds and all sizes, wire of great flexibility and of all numbers. They have recently employed xinc for castings of large size, and we may oscution especially the statue exhibited of Her Majesty Queen Victoria, which, with the pedestal east of the same material, presents a total

height of 21 feet.

The Vicille Moutagne Company has also applied the oxide of sine to replace white lead in bouse painting, and oxide of sine to replace white lead in bouse painting, and for this purpose has recently opened two establishments for the manufacture of the white nod grey xine; one at Anières, near Paris, and the other at Valentiu-Coq, near Liege. The works of this Society have continued to increase, notwithstanding the formation of several new Companies for working calamine and bleede. At the present time it has 80 reducing furances at work, and employs 2640 workmen. The production to 1850 was

500 tons of zine

II, soo tons of zame.

We may add, as jostifying the high distinction awarded to the Vieille Montagne Company, that its zinc is of the best quality, and that the methods of working adopted differ essentially from those pursued in Silesia and England. The objects exhibited are very ounerous, as well in the Belgian as io the French department, but it is not thought necessary to enumerate them after having indicated the uses to which this Company has applied it; we merely repeat that they are remarkable both for quality of material, and for excellence of worknunnship,

PURIFYING APPARATUS OF M. BERARD, FOR REPARATING FROM COAL ANY POREIGN SUBSTANCES WHICH IT NAT CONTAIN, SUCH AS PYRITES OR SCHIST. (France, 51, p.

The washing of coal, a system introduced into France within the last three or four years, is a branch of industry of the highest importance, permitting the ase of coal which by its mixture with schist would not be otherwise employed. It may also be applied with advantage to certain coals, considered to be of good quality, but containing a quantity of ash, which diminishes the value. They are purified by this method in such a way as to allow of the manufacture of a coke from these coals, not containing more than three or four per ceot, of ash. The Great Northern Railway of France has recognized the efficiency of this method, and a considerable part of the coke which it consumes is manufactured of washed coal: there result from its em ployment a marked economy of fuel, and a greater durability of the locomotives,

The expenses of washing, which are considerable by the ordinary method, are reduced to ten or twelve centimes (about a penny), per metrical ton) of fuel by means of M. Bérard's method. A very important deside-ratum may, therefore, be considered as obtained. The apparatus consists of three parts, viz. :-

1. An elecutor, formed of an endless chain with bockets, * These Exhibitors were also awarded a Council Medal

† The metrical ton is equal to 1,000 kilogrammes or nearly an English ton, and contains 10 metrical quintals.— 1. W.

which lifts from a trough or pit where the coals are placed a certain quantity, regulated by means of a valve.

2. A separator, into which the fuel is thrown by the elevator. This is composed of a long box, divided into compartments, and containing perforated plates, in stages, the size of the perforations being smaller and smaller by stages from the upper to the lower, so that by the shaking which this box undergoes, the coal is at once divided into four sizes. The finest powder falls to the bottom, and each of the three sizes of lumps being thrown out through openings in the sides of the box, into separate fixed sieves, called "banes a lavage," which form the third part of the apparatus,

parmus.

3. These "banes à lavage" are long frames measuring 9 feet 2 inches by 4 feet, of which the bottoms are pierced with holes, the diameter of which is smaller than that of the pieces of coal thrown into them. They are cutirely filled with water, and divided in the interior into three parts. In one of these is a piston, which is worked up and down, and gives considerable motion to the water, which being communicated to the materials thrown on the bottom of the tank, these arrange themselves rapidly, in the order of their density, the heaviest being at the bottom. The pure coal alone comes to the surface, and by a current of water proceeding from a trough above, it is carried beyond the tank, and fulls directly into the waggon, whence it is conveyed to its dea-The substances heavier than eval, such as sebist, or pyrites, are deposited on the perforated bottom of the tank, which has a slight inclination towards a trap, and thus constantly advance towards an exit. By a poculiar arrangement, the rubbish is thus made to carry itself into a compartment prepared in the inside of the tank, whence it is removed by the mere opening of a valve,

It will be seen from this description, that the work is continuous throughout, and requires no manual assistance. According to the declaration of M. Bérard, the quantity of coal that can be cleaned in an hour by a machine, the total cost of which would be 10,000 francs (4001.), is ten to twelve metrical tons. The working of such a machine would not require more than about 2000 gallons of water

per day (8 to 10 enbie metres The various specimens exhibited are as follows:-

1. Coals classed in four sizes, and the foreign matters that have been separated from them, 2. Two specimens of coke; me made from coal as it comes from the mine, and the other from "washed roal

The first contains 26 per cent, of ash, the second only 21 per cent. 3. A drawing of the apparatns.

The specimens are from an establishment founded by M. Bérard, at Moleubeck St. Jean, near Brussels. M. Bérard states that his apparatus has been adopted by the mising companies of the Loire, Creazot, Epinac, &c., in France, and that, at the present time, there is one being erected at Newcastle.

VARIOUS OBJECTS IN BEASS, EXHIBITED BY MESSES, ESTI-VANT, BROTHERS, OF GIVET (ARDENNES). (France, 1214.

The Messrs, Estivant have forwarded a complete collection of their manufactures in brass; and the namerous objects which are included in it are all remarkable for admirable workmanship. We here mention only those which have attracted the attention of the Jury by their extraordinary dimensions, and difficulty of execution,

1. A sheet of rolled brass, measuring 15 feet 9 inches by 3 feet 7 inches, and less than a quarter of an incb (*2362 inch) in thickness; weight 561 lbs.

2. A sheet measuring 51 inches by 49 inches, nearly 2 inches (1.93) thick, weighing 1466 lbs. 3. A round bar of hammered brass, 8 feet long, and 4.88 inches in diameter, weighing 550 lbs.

4. A square bar of rolled brass, 11 feet 7 inches in

length by 4.75 inches square in the section, weighing

5. Two pans of hammered brass, each 7 feet 7 inches in diameter, and 15.75 inches high. The weight of the one is 101; lbs., and of the other 110 lbs.

6. A rolled sheet of Dutch metal (tombac), measuring 80.75 inches by 26.33 inches, and weigbing 7 lbs. 114 ouuces.

 Brass wire of different sizes, one specimen less than the twentieth of an inch (1½ millemetre) in diameter, measuring 3691 yards in length, perfeetly uniform throughout, and weighing 105 lbs.

8. A book of extremely fine Dutch leaf, very strong and very tough, and without flaws.

All these are objects of ordinary manufacture. The large pans are employed in dyeing, and in the manufacture of glue; the large bars are used in ship-building; the fine leaves are intended for plating and coating wood; the large rolled sheet has only been smoothed on one side, to show that the others are as they were run out, and the same is the case with the square bar, of which one end has been sawn. The dimensions of these specimens in-volve great difficulty of execution, both in first casting, and subsequently manufacturing; with regard to the former, Mesars. Estivant, although using nearly the ordinary proportions of copper and rine for the brass, adopt special precautions to render the alloy homogeneous. All brase manufacturers are able to cast slabs of about a hundredweight, and roll them into sheets weighing upwards of half that weight, but few of them are able to cust such masses as those exhibited bere, without flaw, and roll them into sheets without flaws, even to the edges. and rou toem into secest without flaws, even to the edges. This establishment, therefore, completely fulfils the con-ditions imposed by the regulation, which requires for the Conneil Media" excellence in known modes of obtaining, applying, or adapting the raw material."

The annual make of Mesars, Estivant exceeds 1800 tons,

and represents a value of about 80,000L

SEPARATION OF GOLD FROM ARSENICAL PUBLICA, BY . GUETTLER, ACCORDING TO PLATTNER'S METHOD. (Prussia, 6, p. 1048.)

The mines of Reichenstein, in Silesia, abandoned for more than five centuries, have been recently opened with advantage, in consequence of the application, on a large scale, of a method invested by Professor Plattner, for separating gold from the waste of arsenical ores.

The ore at Reicheusteiu is an arsenical pyrites, con-ning about 200 grains of gold in the ton. The ore is taining about 200 grains of gold in the ton. roasted in a reverberatory furnace, surmounted by a large condensing chamber, in which the arsenious acid is con-densed as fast as it is volatilized. There then remains, densed as fast as it is volatilized. There then remains, on the floor of the furnace, oxide of iron mixed with a certain quantity of arsenic, together with the whole of the gold. This is placed in a vessel so arranged that a current of chlorine can be passed through it, by which the gold and iron are taken up, and afterwards separated from the residuum, by the aid of a certain quantity of water, and the gold is afterwards precipitated from this solution by sulpharetted bydrogen. To prevent the admixture of iron at this stage, a small dose of hydrochloric acid is added to the solution before the sulphuretted hydrogen is introduced. The nuriferous compound having been separated from the liquor, is washed and heated in an open porcelnia crucible, to drive off the sulphur, by which the gold is reduced to the metallic state by fluxing it in the usual

This simple and ingenious method, which has made it worth while to re-open the Reichenstein mine, is equally applicable to the vast quantity of refuse accumulated near many other old works. In awarding the Council Medal, the Jury have desired in this case to associate the name of Professor PLATTNER, the inventor of the method, with that of M. GUETTLER, who has brought it into operation on a large scale.

STEEL WORKS OF F. KRUPP, AT ESSEN, NEAR DUSSEL-DORF. (Prussin, 649 & 677, pp. 1086, 1087.)

This establishment, which has been erected at great cost and heavy sucrifices by its founder, is distinguished for the superior quality of the east steel made there, and yet more ly the large dimensions of the objects produced. The Jury is not nequainted with the methods adopted by

vig :-

M. Krupp for obtaining pieces of all dimensions, which appear, however, to differ in many respects from those pursued either in England or Germany. Of the objects exhibited the Jury have remarked a pair of cylinders for rolling steel; a rough cylinder, nearly four feet long, and weighing 4,300 lbs.; the axle of a railway carriage, weighing 100 lbs.; and a cylinder 15 inches in diameter, broken across the middle. The last magnificent specimen has chiefly attracted the attention of the Jury on account of the fineness and homogeneity of its grain throughout, The Exhibition does not show from any other country a bur if east and forged steel of such large dimensions and of equal heauty. The members of the Jury do not re-member to have seen anywhere a similar example.

M. Krupp has also exhibited cuirsses and carriage springs, to show both the strength and elasticity of his stee L

PRIZE MEDALS AND HONOURABLE MENTIONS.

Most of those who bave obtained these medals, or who are honography mentioned, have exhibited objects of ordinary manufacture, but of good workmanship, Concerning these it has been thought sufficient to prepare a very shurt notice; but we have given more extended details in the case of those who have introduced a new principle, ur a new application of known principles; and we have also dwelt at some length on those objects which are instructive, and on collections from countries little known, their study offering a great interest in geological researches, and in the development of the industry connected with minerals. It is to be regretted that these collections are only accompanied by a few isolated notes, which give but very imperfect information as to the nature of the formations, and the position of the rocks which contain them. We propose, as mentioned in the beginning of this Re-

ort, to enumerate those exhibitors who have obtained port, to enumerate more camputers.

Modals or Honourable Mention, the respective countries to which they belong following in the same order as in the Official Catalogue of the Exhibition.

THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND. Great Britain is the most favoured country in the world for the development of mineral industry. Fuel, the indispensable agent in the treatment of metalliferous ores, and the most powerful element in the production of mutive force, is distributed unequally throughout the three countries of England, Scotland, and Ireland, coal formation in these three divisions of the British emnire occanies rich and widely-spread basins, several of which, especially those of Newcastle-on-Tyne, Scotland, and Wales, being situated near to the sea which surrounds the whole country, are enabled to export the coal to those places where the metalliferous ores exist in abundance, but where, as in Cornwall, the absence of fuel renders their being worked both difficult and costly. The ores of iron, abundantly distributed in several of the coal busins, add greatly to the value of these. Each one so circumstanced has become the centre of a metalliferous district, where numerous works produce iron at a price so moderate, that no nation can compete with this manufacture with any chance of success. The insular position of Great Britain, which allows the coal to be conveyed almost for nothing wherever it is wanted, is equally important in enabling the iron to be conveyed by its shire throughout the world. These highly favourable cond tions have given great development to the operations of coal mining and the manufacture of iron, and this has been especially felt since the application of cast iron for purposes of construction and the formation of the great lines of railroad.

The quantity of cast iron produced in England is as follows:-In 1836 . 1,000,000 tons.

In	the	follow	ine	YOUR.	owing	to earts	in	importan
		1845				1,512,500		
		1844				1,210,000	77	
		1840				1,336,400	99	

fiscal alterations, the trade received a great stimulus, and the make rose-

In I	184	8	to	1,998,588	tons.	
	184	3		2,000,000		
	183	9		2,250,000	21	

and in 1851 to an amount probably me quantity made in 1844—seven years previously.

The quantity of coal raised in 1840 is not accurately

known; but in 1850 it is estimated at 34,750,000 tons The increase must have accompanied that of the make of iron, of which it is one of the most essential elements The average price of coal at the pit mouth in England is estimated at \$4.7d., and that of pig iros at 48s. The produce of these two branches of industry amounts therefore to the anaual value of upwards of 15,000,0001.

34,750,000 tons of coal at 5s. 7d. per ton . £9,701,000 2,250,000 tons of pig iron at 45s. " 5,400,000 £15.101.030

Of this vast production about one-half of the iron and one-fourth part of the coal are exported to the colonies or to foreign countries.

These sources of wealth in coal and iron, which are alone sufficient to place a country at the head of mineral industry, are not the only ones possessed by England Nature, liberal to profusion towards this favoured country, has given it mines of copper, of tin, and of lead, also of great richness. Perhaps some day a formidable competition may arise in the case of copper, by the working of enormous musses of native copper discovered on the

shores of Lake Superior; but at present the Cornish mines furnish, as we have already remarked, two-thirds of the whole of the copper consumed throughout the world With regard to tia, England divides with Saxony and the Indian Archipelago the monopoly of the trade in Europe The annual production of copper in Cornwall may be estimated at about 12,000 tons, the value of which

amounts to upwards of 800,000/, sterling. The quantity of tin or obtained annually may be estimated at 11,000 tons, the average yield of which is 65 per cent., or about 7,000 tons of metal: this, at 90% per ton, would amount to 560 0007

It is often supposed that England, so rich in regard to iron, copper, and tin, is comparatively poor in lead, or at least that the lead-mines are of secondary importance. This is an error arising from the fact that the production of lead, instead of being concentrated like that of copper in one or two districts, is spread over a great number of mines. Some, like those of Alston Moor in Cumberland. of Snailbatch in Shropshire, or of Wanlock in Dumfriesshire, are indeed well known, but most of the others are comparatively anknown. Their number now ithat adding is considerable, owing to the wide extent of paleoneer rocks in Great Britain, and they raise the total of production in this metal to an amount which may perhaps place England also at the head of supply in this respect. Spain is at any rate the only country that can come into compe-

We were not felly aware of these results when the subject first came before us; but they have been communi-cated to us by Mr. Robert Hunt, who is well acquainted with the mineral industry of Great Britain. According to his statement it appears that the production of lead in England is distributed in the following manner among the principal metalliferous districts :-

tition with ber.

Comberian and West	i, i)	reland	n, Ne	rthur	nberh	and,	29,803	20,850
Derbyshire.	Sh	ropeh	ire, &	Som	crnets	hire	10:016	6,776
Yorkshire							7,506	5,596
Wales					- :		19,711	13,389
Ireland							2,739	1,653
Scotland							1,421	937
lsle of Man							2,826	1,535
							86,750	58,701

* To this quantity must be added 6,913 tens of copper from foreign ores, 1851, the value of which is 522,5900

In this statement of the value of the lead in England we have retained the account of the quantity of ore raised. The comparison of the two columns establishes the fact, that only 68 per cent, of metal is obtained after the mechanical preparations are completed, this being the average yield of the ores of lead in England; whilst, on the other hand, as much as 75 to 80 per cent, is obtained

on the Continent. This difference in the yield of the ores is the result of the low price of fuel in England. The brief account of the mineral wealth of Great Britain which we have here given previously to making known the results of the Exhibition, is sufficient to prove how great an interest the subject would possess if the statement could be made more complete. regret on our own account that, for the reasons given in the commencement of this Report, so many persons have declined sending contributions to the Crystal Palace. In consequence of this there are many blanks which prevent our being able to form a satisfactory idea of the immense development of mineral industry in the British Islands; and the existence of such blanks render it impossible to make a systematic classification of the objects exhibited, which would be of erest one in the statement we are about to make of the rewards decreed by the Jury. This difficulty induces us to describe in succession the several establishments which have obtained Medals and Honour-

able Mention. In each of these groups we shall combine the objects which offer the closest analogies. PRIZE MEDALS.

COLLECTION OF ORES OF IRON, ILLUSTRATING THE GENE-RAL IRON-MAKING RESOURCES OF THE UNITED KING-

вом. (427, рр. 150-159.) The production of iron in England, which was only 30,000 tons in 1750, suddenly increased to 180,000 tons on the important discovery by Mr. Cort of the process of puddling with coal. It is now 2,250,000 tons. This vast production is distributed nearly as follows:—South Wales and Monmonthshire 700,000 tons, Staffordshire and Shropshire 600,000, Scotland 600,000, and the remainder

in different proportions among the other coal districts of One of the chief causes of the development of the iron trade in England has been the occurrence of iron ores in layers amongst the coal measures, so that the ore and coal for smelting it are found in the same spot, while not unfrequently the coal measures also contain the refractory elay used in the construction of the smelting furnace, and

the limestone needed as a flux occurs at no great distance. the limestone needed as a flux occinisal to great distance. Mr. S. Blackewall. (427, p. 150), in the interesting col-lection which he has exhibited, has placed this important fact in the strongest light. He has broaght together the materials used in supplying each principal group of iron works, carefully imilicating the exact localities whence these materials are obtained. We may thus see that the ores are not carried far, execpt when there is great faci-

lity of transport by canal or railroad The ores from the coal measures furnish, as has been just remarked, the larger part of those used in the iron

works; but the resources of Great Britain are far from being limited to such ores, and Mr. Blackwell's collection farnishes with respect to this matter very interesting facts which we think it right to quote, and which the Jury fully considered in adjudicating to him a Prize Medal. The carboniferous or mountain limestone of Lancashire, Cumberland, Durham, the Forest of Dean, Derhyshire Somersetshire, and Wales, contains important veins of humatitie iron. This ore is worked in large quantities at Ulverstone, Whitehaven, and the Porest of Dean. The

brown hamatite and carbonate of iron exist in large quantities in Alston Moor and Weardale, but these over are not at present extensively worked. In the old rocks of Devonshire and Cornwall are found veins of hematite, of which a large quantity is exported to the ceal districts of England, and especially to Newcastle-on-Tync. The Forest of Dartmoor is rich in magnetic oxide of iron, The has and the onlite contain thick beds of argillaceous carbonate of iron, which are just now the object of extensive operations.

COLUMN REPRESENTING A COMPLETE SECTION OF THE THICK COAL OF STAFFORDSHIRE. (Outside 53, pp. 116, 117, 1

The coal formation of South Staffordshire and Dudley has a thickness of about 315 yards, and 11 beds of coal are known. That which occupies the sixth place in descending is designated as the "main coal," and is the principal object of working. It has a thickness of 10 yards I foot 6 inches, and is found near the town at a depth of about t20 yards. It is assally regarded as a single bed of coal, but really consists of 12 beds, separated by thin layers of sehist called partisys. The presence of these schutose portions, and the difference that can be traced in the quality and appearance of the coal, leaves no doubt about the matter. Messrs, Bacasta, and Jesson. doubt about the matter. of West Bromwich, near Birmingham, have thought that it would be interesting to show the whole of this enormons thickness of coal, and have prepared a column of the total height in which the schistose partings are carefully preserved. In order to strengthen it in its position and preserve it from injury, the column has been placed in a large box with one side open, and covered with a shed, within which is placed a sectional drawing marking the name and the thickness of each seum, and the use to which the different varieties of coal are commonly applied. Considered as an object of instruction and information, the bringing together these different materials is a work

of great interest.

COLLECTION OF TURQUOISES. (20, p. 122.) In the year 1849, Major C. Macdonald made a journey

into Arabia Petrera, with the intention of study geology of the country, as well as those antiquities of whose ence he had convinced himself in a previous journey in 1845. In the course of his investigations he discovered in the country of Soualby, sixteen days' journey S.E. of Suez, five or six localities in which turousises existed, all included within a range of about forty miles. They are situated on the further side of a chain of mountains having an east and west direction, and having a mean

elevation of five or six thousand feet. Major Macdonald collected most of his specimens of quoise from the ravines descending this chain, but ho found some in site. These latter are still attached to the parent rock, which is a reddish sandstone composed of quartz grains. It rescubles in appearance the old red sandstone of Brecon, and some schistone portions confirm us in the opinion that the rock belongs to the paleozoic series.

The colour of the turquoises discovered by Major Macdouald differs in the shade of blae from that of the turquoises of Persia, but agrees exactly with those brought from Abyssinia by M. Rochet d'Héricourt. Both exhibit small globular concretions, whose hardness is equal to that of agate. The nodules of turquoise form groups almost like current-seeds in the sandstone. The intensity of the colour of adjacent lumps is different; and when the groups are of tolerably large dimensions, zones of different tints may be observed. We have remarked in this fine collection of Major Macdonald—which contains more than 200 specimens cut and polished—one stone, an cabachon (polished without cutting), divided into three zones in which the colour varies from an intense blue to a bluish white.

This collection also presents, besides the small concretions, veins of turquoise from a tenth to a twentieth of an inch thick, which cut across the bedding of the sandstone like small threads.

Major Macdonald experienced many difficulties and rest fatigue in his journey through the desert country. he temperature was often as high as 110° Fahr, Besides those forming his escort, he employed for some geological researches; and in addition to the fine collec-tion of turquoises, of which we have just given some details, he brought away several specimens of iron and copper ore, which, from their nature, support the opinion we have offered as to the age of these mountains of red sandstone.

The analogy of external characters in the cuse of

the turquoises from Arabia and Abyssivia is a remarkable fact. It would be interesting to compare the chemical composition of both with that of the Persian turquoises.

HONES, GRINDSTONES, AND POLISHING STONES. (84, p. 130,)

Mr. C. MEINIG is the proprietor of one of the most im-portant establishments in England for the preparation and sale of hones, grindstones, and polishing stones, and obtains his materials from all parts of the world, notice especially among the hones (oil stones) which he prepares, those of Turkey, Persia, the Arkansas, the banks of the Niagara, Spain, Peru, Ireland, and Wales. All these stones, notwithstanding the difference of locality whence they are obtained, possess very remarkable analogics. They are of a yellowish-white colour, fine-grained, and all appear to belong to altered argillacous

schists of the palicozoic period.

The grindstones offer greater variety than the hooes, not only in the different localities whence the materials have been obtained, but in their respective uses. The establishment of Mr. Meinig has exhibited more than 200 kinds of grindstones, varying in size from half an inch to 24 inches, and adapted to all purposes, from the cutting of diamonds to the shaping of swords and bayonets. All of them are quartzose sandstones, of various degrees of fineness, according to the purposes for which they are in-

SPECIMENS OF CORNISH PORPHYRIES. (141, p. 136,) Mr. JAMES HENRY MEREDITH, of Cornwall (141), has exhibited a collection of porphyry slabs, remarkable for the beauty of their polish. They include—

- e beasty of their points. They include—

 1. A black porphyry slah, polished on both faces.

 2. A red porphyry slah, also polished on both faces.

 3. A green porphyry slab, polished on one face.

 4. A porphyry table, in which are inhalid 34 specimens of rocks, from the parish of Withiel, in the county
- of Conwell

These various slabs have been ent and polished in the granite-entting works of Fowey Castle Mine, in the parish of Ty wardreath. They are frequently used as paving-stones in the entrance-halls of large public hulidings or private mansions. The mechanical contrivances used in polishing reader the price very moderate,

COLLECTION OF ENGLISH GRANITES, MARRIES. BUILDING STONES (160, p. 137), AND CORNISH GRANITE OBELISK. (Outside, 14, p. 114.)

Messrs. W. and J. FREEMAN'T have exhibited a collection of granites and marbles, as remarkable for their varieties of colour as for the beauty of their polish; and the machines that they employ for cutting and polishing stones and marbles permitting them to supply them at a moderate price, it results that the slabs and paving-stones of granite and porphyry, which were formerly employed only in public edifices and hat for decorative purposes, on account of their great cost, are now to be seen frequently in private houses and for purposes of utility. As an example of the power of the machines which they employ in quarrying hard stones, Messrs. Freeman have exhibited an obelisk too large to be admitted into the interior of the Crystal Palace, and which is placed on the south side of the West façade. This obelisk is constructed of a large-grained granite from the Lamorna quarries, in Cornwall: its height is 22 feet 4 inches, and its weight 21 tons. It is placed on a pedestal of another granite worked in the Carnsew quarry, weighing 31 tons. The working of blocks of granite large enough to furnish these two magnificent specimens offers difficulties so considerable, that the Jury have thought it right to mark their sense of them by awarding a Prize Medal to Messrs, Freeman.

. This Exhibitor was awarded a Medal by the Jury of less XXVII., ln whose Award List his name appears, -1. W. + This firm was awarded a Medul by the Jury of Class XXVII , in whose Award List its name appears .- 1. W.

SLATES FROM THE FESTINIOG QUARRIES, N. WALES. (210, p. 141.)

These states, which are of superior quality, are chiefly in use for covering buildings. They are also employed as walls for cisterus intended to hold water; but in this ense large slubs are required. Several such slubs are exhibited some of which are more than 15 feet by 8 feet, Most of them are dressed to a rough polish, hat one is in the state in which it came from the quarry. Dendritic markings may be observed on its surface. The Jury markings may be observed on its surface. The Jury have awarded a Prize Medal to Mr, Jons W. Garaves, who is the proprietor of the quarries at Festiniog, and superintends the works, METHOD OF CONDENSING THE SULPHUR PUMES PRODUCED.

IN THE REDUCTION OF LEAD ORES. (509, p. 176.) From the chiumeys of the roasting fornaces in lead works there escape sulphurous vapours injurious to the works there escape surpairious vaporise in the first one to the health of the workmen, and producing great destruction to the vegetation in the neighbourhood. To obviate this mischief, the Duke of Breezeven has caused to be erected at his works at Wanlock, in Dumfriesshire, a large condensor, in which the deleterious vapours are collected. His Grace has exhibited a model of his furnaces and of the products obtained at his works.

nacce and or the products obtained at his works.
The condenar, constructed about 100 yards from the smelling furnacce, consists of a solidly-huilt rectangular hock of masonry, about 20 feet high. It is divided by a partition into two chambers, the first of which hy a partition into two chambers, the first of which the condensity chamber, receives the funnes from the furnaces directly through a large pipe; while the second, called the exhausting chamber, communicates with

a very lofty chimney constructed in the form of a tower, The condensing chamber is itself divided into two distinct compartments by a pair of vertical walls placed only two feet from each other, and forming a kind of flat pipe, open at the top, of the whole width of the chamber, and constantly receiving water falling in drops like rain. The water is thus broken into rain by passing through a filter of pounded coal placed in the upper part of the flat pipe at a height of six feet. Four horizontal partitions, or floors, divide the condensing chamber into five compartments, each six feet high, the last exactly corresponding to a bed of coal which forms a filter for the smoke, as the one already described does for the water. The smoke, at its entranec into the condensing chamber, is obliged, in order to reach the exhausting chamber, to pass oninged, in order to reach the exhausting channer, to pass in zig-zags across the five compartments, and then go through the bed of coal. The opening which conducts the smoke from the exhausting chamber into the chimney is placed in its lower part, so that the smoke has to pass through the whole of the exhausting chamber before eaching it, and in its course it needs an abundant shower of rain, which sweeps down all the insoluble portions which

are deposited along the walls of the exhausting chamber.
To obtain this shower in a regular and mi form manner. the following contrivance has been adopted in the upper part of the chamber. The top is covered with a large part of the channet. The top is covered with a large iron lid, having twelve grooves about an inch wide, giving it the appearance of a gridiron. On this lid is a slide, having openings of the same size, and moving upon it so as to open or close the grooves in the lid, and a current of water being conducted from the upper part of the chamber, falls at intervals through the openings, and produces a copious shower in the empty chamber.

The atmospherie pressure acts on each movement of the slide with a force resembling that of the librat of an iron firmace, and produces an action sufficiently powerful to mix the impure vapours with the water, so that the smoke at length passes into the atmosphere deprived of its injurious properties. The saturated water proceeding from these chambers is afterwards conducted into a reservoir, where it deposits the particles of lead salts that the fumes had carried off.

MODELS OF THE FURNACES, &c., OF THE EBBW VALE

COMPANY, (412, p. 149,) This Company makes use of the gases escaping from the smelting furnaces to supply a steam-engine, and has exhibited a model (on the scale of an inch to the foot) of a part of their establishment, consisting of two furness. The gases coveryed from their furness between six and other parts of the part

Model of a Contrivance for Opening and Shutting the Ventilating Doors of Mines by means of a system of Levers. (418, p. 150.)

Mr. Bousary Mitae has laterduced into the coal mine of Yoxhole, now Swansea, an arrangement of levers by which the doors connected with the vocalitation of the waggess through them. During 22 years that this method has been it use, there has not been a tingle explosion that have been to been a tingle explosion arrangement provides against the negligence of workness, causes good ventilation by keeping the doors regularly mining, have awarded a Prize Modal to this cabilities.

SAFETT FUSE FOR MININO PURPOSES. (423, p. 150.)
The safety fuses here exhibited by Musers. BUCKFORM.
The safety fuses here exhibited by Musers. BUCKFORM.
SHITH, and DAVIT, consist for small thread of fine gunpowder twisted into the middle of a rope, if which the strands have been separately larred, the whole rope being afterwards also turred. The different kinds of safety fuse vary according to the coating employed to enable them to

resist the pressure of water.

Safety fines, invested 15 or 16 years ago, have since
then been of great service, not only on account of the accidents they have prevented, that by the facility with which
they allow of stots being fired in mines, under water, and
in ite., They are lighted in the usual way, and communite
ite., They are lighted in the usual way, and communite
ite., They are not injured by exposure to
we, and effect a sarring in the quantity of powder required.
APPARATYS FOR CRISICISM OF THE DIRECTION OF ROTATION
ARCHITECTURE OF THE STATE OF TH

The model of stamping machinery applied to crushing copper and tin oces in Coruwall exhibits a peculiar method for reversing the direction of rotation, the invention of Mr. R. Hosking, to whom the Jury has adjudged a Prize Medal.

Onelisks of Coal and Building Stone, &c. (430, pp. 459-461.)

The carboniferous system in Wales contains a very compact fune-grained grit, which furnishes an extremely solid fecentors, resisting the action of fire. The Abercara and Gwythen Collisires Company has exhibited an obeliak of this stone (Abercara), having the faces differently worked, in order to show the grain of the stone and the manner in which it may be cut. The same exhibitors send also the different varieties of

ceals from their locality, and the tools used in quarrying the Abercara stocks as well as a description of the methods adopted by them in deepening the shafts of misses. Several of the tods are of most alway, and none apopure to be well adapted for use. The mede of deepening shafts has also that the special of the state of the shaft of the state that operation. This double reason has induced them to ward a Prize Medal to Mr. Farkstern Rockers, who represents the Ausencean ASO GWITTIS COMPANY. SEXMARTON OF WOLKEN FROM THE ORDING OF The IN THE PREVALENTS OF THE STATE, (485, p. 172.)

THE PREFABRATION OF TIX ORES. (485, p. 172.)
Mr. Romera Oxland, of Plymouth, who has invented
this method of separating wolfram from the oxide of tin,
has exhibiting a complete collection illustrating the successive operations of which it consists.

Wolfram having a specific gravity of 7 to 7:5, and

therefore but little greater than oxide of tin, which is about 65, it is wellnigh impossible to separate the two minerals by washing, and all that can be done by the usual modes of mechanical preparation of tin ores is to bring them to a state in which they are mixed with wolfram out.

After determining by mustysis the proportion they contain, a sufficient quantity of sulphate of soda is added to ensure an excess of soda relatively to the tangetic acid, and the whole is then maked with charced dust to deconsize the solid properties of the solid properties of sulphine. The mixture is placed in a reverberatory furnace, of which the bels in of cast iron, and is first exposed to a smally or reducing fusure; but afterwards doing flame.

The subplace of sold heige transferred into subplace to the transparent of son the contract the real terms and the contract the real terms and the contract of a very flar powder. The transpare of sods is after of a very flar powder. The transpare of sods is after sold of the contract o

Collection illustrating the Manufacture of Lead, (494, p. 173.)

Mr. Jossuz Byran, proprietor of a lead mine in the county of Durham, worked by himself, has exhibited a series of his products, which tocludes the lead ores as abtained from the Grass-hill Mine, the ores prepared for smelting, the lead in pig, sheet lead, and lead piping. There is also a cake or button of silver, and the different qualities of lithrage obtained during expellation.

quanties of simple obtained during cipetation.

The slags which accompany the common and refined lead illustrate the successive conditions through which the ore has to pass in obtaining the various merchantable commodities.

Collection illustrating the Iron Trade. (411, pp. 148, 149.)

Mesra, W. Bran and Co. exhibit an extensive collection of specimens of iron, illustrating the makes of different localities, from the lowest-priced, "pig." naunfaction of the control of the "cold-blat." Also specimens of these severally decarbenized into-related metal, and manufactured into the smith of the control of the control of the control and Sevaluad. The several stage of the manufacture are illustrated by exhibits of railroad bars, baller-plate, shrincashie, implates, serne-plates, boller-tubes, wire, &c. ex-mullifaction of the extent and viette of the iron masses.

emplification of the extent and variety of the iron manufacture of Great Britain, the descriptions exhibited being those of the sorts in every-day demand for bone consumption and fir export. It represents an annual make of not less than 500,000 tons.

of not less than 500,000 tons.

Forming part of the collection are two articles deserving

of special usides:—the one a round bar of irea, rolled at the works of John Baganil and Sons, of West Horowich, 20 feet 1 inch long, 7 inches in diameter, and weighing 20 feet 1 inch long, 7 inches in diameter, and weighter 10 feet inch long, 7 inches in diameter, and weighter 10 feet inches inches inches in the property of the the works of Selhy and Johns, of Sauchiwick. The Jury award a Priza Media to Mears. We Bars and Co. for their well-arranged and extensive collection, and to Mears, respectivity, for the excellence of their productions.

Specimens of Sheet Iron coated with Tin, Zinc with Lead, &c., by the Galvanic Process. (436, p. 161.)

These specimens, exhibited by Musers. Monewood and

ROGERS* (patentees), are good illustrations of the process peculiarly employed in their manufacture. The Jury being satisfied that the objects exhibited are of fine quality, and that some of them are difficult of execution, especially the sheets of galvanized tin-plate, which are of unusual size, measuring 8 feet by 3, have awarded them a Medal.

SPECIMENS OF RARE METALS AND METALLIC COMPOUNDS. (477, p. 166,)

Messrs, Johnson and Martiney, chemical manufacturers, have exhibited a complete collection illustrating the manufacture of platinum; consisting of erueibles, eap-sules, and a large pan of that metal. But that which has chiefly interested the Jury, and has induced them to grant a Prize Medal to these exhibitors, is the series of products, including palladium, iridium, rhodium, and nranium,

SHEFFIELD STEEL

The steel of Sheffield has long enjoyed an European reputation. Almost every country is a tributary to its works; and nutwithstanding that manufactures of steel works; and notwithstanding that manufactures of steft have risen up in different parts of the Continent within the last twenty years, Sheffield has not ceased to develop its beautiful industry. Six firms have sent contributions to the Crystal Palace, and the Jury, after having made a careful examination, have decided to give a Medal to each of them ; and notwithstanding that two have sent a more numerous and more neatly-arranged collection thon the others, they are thus all placed on the same footing. These respective firms are

JOHNSON, CAMMELL, and Co. of the Cyclop Steel Works (XXII., 109, p. 605.) Cornen, S., and Son, Porter Steel Works. (XXII., 115,

p. 606.) Tuston and Sons (xxii., 190, p. 614), and

Evar, Wann, and Co., † (xxxt., 203, p. 615). The objects exhibited by these two firms represent the

same manufactures. me manumentes.

Butches, W. and S. (xxii., 192, p. 614.)

Navios, Vickess, and Co. (xxii., 199, p. 615.)

These different manufacturers have exhibited various samples of steel in ingot and bar, and adapted for all pur-

Two manufacturers, Messrs, Johnson, Cammell, and Co., and Messrs, Naylor and Co. (p. 605), have also exhi-hited models of their works. That of Messrs, Johnson is rather a general plan than a true model, but Messra Naylor (p. 615) have forwarded a model complete in all the furnaces, on a senle of an inch to a foot. It is finished with much care; the furnaces are so contrived that they can be opened, thus showing their internal arrangement as well as their external furm. The works of Messrs, Naylor with 90 "holes," or 180 erueihles. They employ 150 workmen, and produce annually 2,300 tons of steel. This

is about a sixteenth part of the whole quantity of steel made in Sheffield, which may be taken at 35,000 tons, of which 18,000 are cast steel, Besides the instruction which the study of Messrs Navior's model is calculated to afford, the exhibition of their products is remarkable for an arrangement which admits uf the different processes of steel making, from the cementation to the final production of hars for sale, being

We must also mention, as amongst the objects exhibited hy Sheffield, two ingots of steel which may bear comparison in size with the fine specimens exhibited by M. KRUPP, of Dusseldorf (649, p. 1086). One of these, from the esta-hlishment of Messrs, Cocker and Son (115, p. 606), weighs 6 cwt, 3 qps. 18 lbs. The other, called the monster ingot, financiar of seesaw, Cower, and con (110, p. 100), angu-feewt. 3 qps. 18 lbs. The other, called the monster ingot, weighs 2,688 lbs. It is 5 ft. 11 in, long, and nearly 14 in, in diameter, and was manufactured at Messrs. Turton's works, (190, p. 614.)

esamined.

* These Exhibitors receive a Moial Io Class XXII., in To recider this collection more interestion, and really a summer Award List their names are inserted—I, W. In Superior Moial of the Class XXII. in Janv of Class XXII., in Janv of Class XXII., in Janv of Class XXII., to whose List their names are inserted—I. W. In Janv of Class XXII., to whose List their names appear.

MANUFACTURE OF PEG AND BAR-IRON. LOW MOOR IRON Wurks (XXII., 85, p. 601), AND Howeling Iron Com-PANY. (XXII., 83, p. 600.)

[CLASS I.

The Jury has awarded a Medal to each of the establishments mentioned above, which have both exhibited their products, consisting of ores of iron, pig-iron, sings, coal, and bar-iron of different kinds, most uf the specimens of the latter being bent and twisted, illustrative of the uses to which they may be applied, and of their respective

Although the Jury have placed these fine establishments together, it is only right to say that the exhibition of the Low Moor Works belonging to Mossrs, Hird, Dawson, and Hardy (p. 601), is the more complete of the two. They have added to the raw materials and the iron, seeral objects manufactured in cast iron, especially a gun of very large calibre, solid and other shut, and cylinders or erushing rollers used in sugar mills.

GALVANISED IRON AND COPPER WIRE ROPES. (XXII.,

30, p. 595.)
Nessrs. Wilking and Weatherly bave exhibited various samples of their manufacture of metal ropes and eables made according to Mr. Smith's patent. The Jury have recognised the excellent workmanship of these cables by awarding a Prize Medal to the manufacturer.

COAL TRADE OF NORTHUMBERLAND AND DURBAN.

(273, pp. 146, 147.) The COMMITTEE of the Coul Trade of Newcastle-on-Type has exhibited several jostructive documents on the geology of their district and the methods adopted in work-

ing the mines. These include 1. A map of the coal field of Durham and North-umberland, on which are marked the position of

each shaft, the railways connected with each, the faults and other remarkable accidents which have disturbed or removed the beds. 2. Two sections of the field, one from north to

south and the other from east to west, showing the 3. A synopsis affording explanatory details of the man and sections.

4. A model, or relief plan of one of the principal mines in Northumberland, in which the mode of working and ventilating the mines of the district is indicated in detail. 5. Safety lamps used in the Darham and Northum-

berlaud mines, and models of apparatus employed in raising the coal to the pit mouth, and conveying it to the place of embarkation.

 Lastly, a complete collection illustrating the coal formation, including all the varieties of esal found in this important field, the rock associated with them, and specimens of the vegetable markings. We have noticed in this splendid collection, containing 36 well-marked specimens of Ulodendron mains and Uledendron misses, fossils extremely rare in many coal fields

This eollection affords, therefore, a most useful series for instruction, by completely illustrating the most im-portant coal field of England, which gives employment to 26,000 workmen, and annually supplies about eight millions of tons of coal.

COLLECTION OF LEAD ORES AND LEAD MANUFACTURE. (484, pp. 168-172.)

Mr. Thomas Sorwith, F.R.S., has exhibited a complete series illustrating the production of lead, consisting of ores from several mines in the north of England, and specimens showing the different mechanical preparations and smelting processes for obtaining merchantable lead, These specimens are placed to eases with the products obtained, so as to show at a single glance everything belonging to the establishment.

e Allenheads mine in Northumberland, and of Alston Moor in Cumberland, while the faults and disturbances of the beds in the districts where these mines exist are represented in models which Mr. Sopwith has had made after a method invented by himself. The collection includes

1. Sections of the strata at Allenbeads and Alston Moor

2. Models to illustrate mineral veins, &c. 3. Minerals associated with lead ores

4. Examples of the various stages of progress from the mine to the market. 5. Lead and silver prepared for sale.

This interesting collection illustrates almost completely the lead veins of the north of England; and if similar colections existed of the copper and tin mines, these, with Mr. Blackwell's (p. 150) fine collection of iron ores, would form a complete series illustrating the chief metal-

would furm a complete series illustrating the chief metal-liferous districts of England. This collection is highly interesting for the purposes of instruction, and the Jury have awarded a Prise Medal to Mr. Sorwith. HONOURABLE MENTIONS

GRINDSTONES FROM THE ARDSLEY OAKS QUARRY, NEAR BARNSLEY. (Outside, 22, p. 115.)

These grindstones, exhibited by Mr. James Haywoon, which are of excellent quality, are chiefly in ose in Laneashire and Yorkshire, where they are employed in cutting certain parts of machines, and in grinding and mend-ing tools. The sandstone of the quarries also furnishes a good huilding material.

BLOCKS OF COAL, ETC.

We mention here, together, the columns and blocks of coal placed outside the Exhibition Building along the South Side of the Western End, and numbered 34, 41,

47, and 48, namely:-No. 34, exhibited by Mr. EDWARD OARELEY (p. 115),
from the Coed Talon Mines, near Mold in Flintshire, North Wales No. 41, exhibited by Mr. RICHARD BARROW (p. 116), of

Staveley Works, near Chesterfield, Derbyshire. blook of coal of which the weight is estimated at 24 tous, was extracted from a depth of 454 feet. No. 47 is a block of coal from the Brymbo Mines, near

Wrexham, North Wales, and is exhibited by the Bayano CONTANY, working the mines No. 48 is a column intended to give a complete section

of the thick coal of the Barnsley Mines. The different nature of the coals is here indicated, especially those for steam engines, mannfactures, and domestic use. This column, which is from the Elsicot Colliery, is exhibited by the EARL FITZWILLIAM. COLLECTION OF MINERALOGICAL SPECIMENS AND FORSILE

FOR EDUCATIONAL PURPOSES. (14.)

Mr. J. TENNANT has exhibited one tolerably complete collection of minerals, and several smaller collections, to promute the study of mineralogy in colleges, and for general educational purposes. The principal collection con-tains rather a large number of specimens remarkable for their fine state of preservation, and for the distinctness of the crystals, and is earefully arranged and catalogued. The small collections offer on a smaller scale the common minerals, and those of which the knowledge is most useful for the study of geology, and its application to agriculture.

NATURAL AND ARTIFICIAL CRYSTALS OF SULPHUR, AND THE EXTRACTION OF SULPHUR FROM ITS ORES. (23, p. 122.)

Mr. Samuel Highley, jun., has exhibited a series of specimeus of native sulphur, and the ores (such as pyes) from which this substance is generally obtained. He has added the different products obtained in the pre-paration of salphar, and also some crystals of sulphur, produced artificially in the following ways:— 1. By fusion

2. From solution in hisulphide of earbon. From solution in camphine at various temper-atures from 170° to 280° Fahr.

4. From sulpho-pentachloride of phosphorus.

These crystals, which correspond to the two forms ohtained by M. Mitscherlich, possess a true scientific interest. COLLECTION OF GEMS. (24, pp. 122, 123.)

The owner of this magnificent collection, Mr. H. F. TRISTLETHWATTE, has chiefly had in view in its formation to exhibit the great variety of colours presented by each kind of eem, and the close resemblance of tint found in stones of very different kinds, as in corondom, aircon,

and spinette. The cut gens, to the number of upwards of 200, are accompanied by some crystals. We may mention particularly those of the diamond, which present a great variety of forms, and furnish very interesting materials for study to the mineralogist. PHOSPHATE OF LIME, AS EMPLOYED FOR THE IMPROVE-

MENT OF SOILS. (36, pp. 124, 125; 46, p. 125.)

It is now twenty years since there were discovered in the marks of the line and in the lower beds of the cretaceous series, nodules of phosphate of lime due in great part to coprolites. These nodules are tolerably plentiful in the gault of Surrey, and it has been attempted to make use of them both in the production of phosphorus, of which a large quantity is now consumed, and for agricultural purposes. It appears that the large proportion of bone phosphate which they contain, reaching some-times to 70 per cent., produces a valuable manure. At the same time, there are no sufficient data at present with regard to the cost of this substance, which requires to be reduced to a fine powder in order to mix uniformly with the tillage soil, to enable us to determine whether it can be regarded as an available source of improvement.* Experiments on a sufficiently large scala have been undertaken within the last two or three years, and the Jury, wishing to hasten the solution of this important question have made Honourable Mention of the following exhi-

1. Mr. John M. Paine, of Farnham (36, p. 124), who has exhibited a varied collection of nodules containing phosphate of lime from the county of Surrey, and samples of the same substance prepared for the market, 2. Mr. J. C. Nassur, of Kenaington (46, p. 125), whn has exhibited the phosphate in powder as used for

manuro STOURBRIDGE CLAY. (91, pp. 130, 131.)

The Stourbridge clay, obtained from the coal measures is one of the most refractory clays known, and if has long been employed almost alone in the manufacture of bricks used for lining smelting furnaces. For some years past similar clays have been found in several of the Eaglish coal-fields, and Mr. Logan, who has made a special study of the coal measures, has observed, that the beds in contact with the coal, and especially those designated black bond, gene-ally yield refractory clays. That of Stourhridge has thus lost part of its importance, but the facility with which

it is worked makes it still very much sought after.

Messrs, King and Co. (p. 130) have exhibited sperimens
of the raw clay, bricks, and different objects manufactured of the clay, and a model of a glass-house, the interior of which is constructed of refractory bricks

PORCELAIN AND POTTERY CLAYS FROM THE MOBILEY WORKS, PLYMPTON, DEVONSHIRE. (101, p. 131.) These clays, exhibited by Mr. W. PHILLIPS, are obtained from a large deposit recently opened on an extensive scale a few nules from Plymonth, and in the southern extremity of Darimoor. The granite of Darimoor is in some places decomposing, and the china clay has been obtained, as in Cornwall, from a natural process of wash-

 Phosphatic nodules are found mixed up with fossil bones in Norfolk and Suffolk, in large beds irregularly dis-tributed in the Red Crag, one of the lowermost beds of the upper tertiaries. They contain, on an average, about 55 per cent, of phosphate of lime, and are sold at the rate of per cent, or prospinate or lame, and are soon at the last of 25x to 30x, per ton, being used extensively in the manufacture of artificial manures. In the lower greensand of Surrey they are also met with, but their occurrence is neither in such large quantities, nor do they contain so neither in such large quantities, nor do they contain so regular a quantity of phosphate, which, consequently, render them of less commercial importance. ing. The quality is extremely good; and there are exhihited with the raw material numerous objects in porcelain manufactured of it in Staffordshire.

SAND EMPLOYED IN THE MANUFACTURE OF GLASS. (125, p. 133.)

The greenand formulon at Stone, mera Ayleshury, emnian a tolerably thick deposit of foous sand, in the middle of which is a hed remarkable for its whiteness, it is compared of transparent quarts and almost pare, of crown and flist glass. Dr. Lee (125, p. 133; the prepieter of the pits, has exhibited specimens of the sand, besides prima and two spheres of finit glass, in which when the prima and two spheres of finit glass, in which are prima and two spheres of finit glass, in which are prima and two spheres of finit glass, in which are prima and two spheres of finit glass, in which are prima and the prima and

Collection of Oaks of Tin and Copper. (468, 469, 473, pp. 165, 166.)

The Local Committees of Tauno, St. Australi, and Swanner, have exhibited specimens of tin and copper ore from the principal Cornish mines, and have rendered the collections more complete by including the products obtained by the mechanical preparation and fusion of the

The study of these collections will give an idea of all the operations which the ores of tin and copper undergo, from the time when they are detached by the miner from the parent rock to their actual metallurgical treatment. They thus afford considerable instruction to the student, and this has induced the Jury to grant them severally Honourable Mestion.

In the first of these collections there may be observed an interesting nilyer, consisting of an ingot of tin found by Mr. J. N. Simmons in the nines of Ladock, near Truro. Its presence in the old and abundanced works have suggested the probability that this tin was cast by the Phenicians at the time when they carried on a commercial intercounce with Coruwall.

SPECIMENS OF LEAD ONE FROM SNAILBATCH, NEAR SHREWARLEST. (495, p. 173.)

We have given in the commencement of this Report (aste, p. 6) some details concerning the magnificent specimen natural from these mines, and exhibited by Mesars. Throws, William, and Grosars Benn. We may add that its weight is no less than twelve bundredweight.

ORES OF ZINC FROM ALSTON MOOR, CUMBERLAND. (506, p. 175.)

Mr. John Gart has exhibited a series of ores of zine from Alston Moor, including specimens of several varieties of calamine and blende. He has added samples of sheet sine abstained by the treatment of these ores. The Jury has granted an Honourable Mention to Mr. Grey, on account of the good quality of the zine, and some improvements in the method of obtaining it.

PATENT FUEL COMPANY. (230, p. 143,)

The patented invention known as "Warish's Patent Feel" has fer its object the manufacture of bricks made with coal-dast, and thus affords the means of readering resultable amental which is otherwise of every little value. As of the patent is the patent of the patent in the patent i

Model of a Coal-Mine, worked by the Hetton Company at Newcastle. (431, p. 161.)

Mr. J. Water, of Newcastle, have a likely a model, on the scale of an ine's to a flow, of the thickness placed above ground connected with one of the pits worked by the above Company, consisting af the steam-engine with its boilers, the lifting apparatus, the waggons for conveying the coal, &c. The arrangements for bonding the coal are also represented with accuracy. All parts of this manner of the conveying the coal, &c. The arrangements for bonding the coal are also represented with accuracy. All parts of this model are also the ropes, are accusted with much fidelity and care and the conveying the coal and the conveying the coal and the conveying the coal and the coal an

MECHANICAL PREPARATION OF THE VERY POOR ORES OF COPPER, CALLED "HALVANS." (434, p. 161.)

Mr. BICKLAM TAXION, Director of the Tyward-sake mines in Corwayd, belonging to HLRIL the Prince of Wales, has introduced important modifications in the three of the control of the control of the control of the three control of the control of the control of the control have rendered available certain ores hitherto regarded as worthless, and have even obtained from them a considernation of the control of the control of the control of the worthless and have even obtained from them a conoring the control of the control of the control of the model of this mode of preparation, executed with much control of the medium of the control of the control of the control of the medium of the control of the control

It would be almost impossible without a plan to explain the details of an operation so complicated as the mechani-cal preparation of copper ores. We shall give a mere sketch. The ore, after being picked by the hand, is submitted to a crushing mill, different in some respects from that generally made use of. It is then arranged in sizes, and washed on a very long table, where, in a series of sieves shaken by an oscillatory movement, a kind of horizontal broom turning on an axis lightly sweeps the surface of the ore, and removes the finer parts which are at the surface. The netion of this broom united with that of the water, completes the cleansing of the ore; and this apparatus, which the Reporter had not before seen in any mining establishment, has a useful effect, and constitutes a marked improvement in the washing of copper ores. Mr. R. Taylor being a member of the Jury, cannot receive a Medal, as has been stated in the commencement of this Report, but the Jury bave thought it right to make a special mention of his contrivance

APPARATUS FOR ADAPTING THE PISTONS OF PUMPS IN MINES. (462, p. 165.)

Mr. J. Arriva's has remarked, the other in nines the pumps do their produced all the effect regired, in consequence of the warring out of the pistons, thus consists, and the warring out of the pistons, thus consists reviewed, the has proposed as arrangement with that for to object to force the instate framitive of the pistons or the object on the pistons of the object of object of the object

PRODUCTION OF PIO AND BAR ISON AND STEEL. We insert under this title the Hononrable Mention granted by the Jury to six establishments which are similarly circumstanced, and of which the products, all

of excellent quality, are the result of ordinary methods. These are—
The BUTTERLEY IRON COMPANY, of Alfreton, Derbyshire (400, p. 147).

Cautwell, Allies, and Co., Blaina Iron Works, Abergavenny (402, p. 147).

Solly and Co., Sealrook Iron and Steel Works, Tipton,

Staffordshire (410, p. 148).
WINGERWORTH IRON COMPANY, Derbyshire (416, p. 150).
MONELAND IRON and STEEL COMPANY, Lanarkshire

(426, p. 150).

BEECROFT, BUTLER, and Co., of Leeds (415, pp. 149,

These establishments have combined with their products, consisting of pig iron, iron, and steel of different qualities and various samples, the raw underials which they employ, as the ores of iron, coal, and flux.

The series of products exhibited by the Butterley and Monkland Works are more complete than the rest. The proprietors of the former have added a considerable num-ber of fossil remains of plants from the coal-field to their collection, taking care to specify the different beds in which they are most frequently found.

CWM AVON WORKS, GLAMORGANSHIRE. (417, p. 150,) Mr. JOHN BIDDULPH, manager of these works, has

exhibited a series of specimeus of pig and bar iron and tin-plate, which are of excellent workmanship. The tinplate has specially attracted the attention of the Jury by the evenous of the tin coating, its lustre, and the quality of the sheet-iron which forms the basis, IRON AND TIN-PLATE OF CARMARTHENSHIPS, (500, p. 174,)

Messrs, PHILLIPS, SHITH, and Co., of Llanelly, have exhibited a collection of tin plate, remarkable for the branty of its manufacture. It is accompanied by sheet iron manufactured with wood fuel, and especially intended for this purpose.

COLLECTION OF ALLOYS. (487, p. 172.) Mr. C. Jonnan, of Manchester, has exhibited a series of several metals, and the alloys that may be obtained by mixing them, vis., gold, silver, platinum, nickel, lead, copper, tin, zine, bismuth, antimony, arsenie, cobalt, man-ganese, iridinm, cadmium, and pulladium. Each of these metals and its alloys is represented by a small hutton with polished faces, and even by broken specimens, to show the lustre and texture. For scientific and industrial pur-poses, this collection offers much interest. A notice accompanying the collection states the ex-

osition of the different alloys made by Mr. Jordan, and the temperatures at which they are obtained,

REDUCTION OF ARSENIC. (488, p. 173.) The ores of tin are mixed with rather a large pr tion of arsenical pyrites. The arsenic is separated by a preparatory roasting, and deposited in the state of white exide in the condensing chamber above the furnace. T. GARLAND, of Redruth, who has devoted himself to the manufacture of arsenie, has exhibited a series of specimens of his products. He has arranged them in such a way as to show the different processes employed for obtaining the pure oxide and metallic arsenie.

GEOLOGICAL COLLECTION OF THE BRISTOL BASIN. (29, p. 123.)

The Bristol basin offers examples of all the geological formations from the upper colite to the lower paleozoic deposits belonging to the Silurian system. To give a real interest to his collection, Mr. T. Howard has accompanied it with a detailed geological map of the district, and with sections which show the position of the different

beds and their relations with each other, Ores of iron, zinc, and lead, and specimens of coal, complete this interesting collection; they are arranged according to the formation, so as to present the useful minerals peculiar to each geological group,

SECTIONS OF THE SCOTCH COAL-FIELDS. (220, p. 142.) Mr. D. LANDALE has exhibited four sections of the Scotch coal-fields of Ayrshire, Lanarkshire, Mid-Lothian, and Fifeshire, respectively. These sections are not the result of direct observations, but they have been constructed by comparison of the different mines or natural sections observed along the coast, or in the numerous sections observed along the coast, or in the summons escarpments always existing in mountainous countries. According to Mr. Landale's observations, the Mid-Lothian coal-field, in which Edinhargh is situated, contains 36 seams of coal, and the Fifeshire field 37.

These sections are the most complete that are known of the district. They illustrate the whole ceal basin of Scotland, one of the largest and richest found in the British islands. They possess, therefore, much interest for the geological study of Scotland, and may in certain cases be referred to as affording a useful guide in working the coal.

We may state here once more that Ordinary Mention or a special notice, has been given for productions of

good workmanship, but which have not attracted the attention of the Jury by any nequestionable superiority or novel process of manufacture.

However, not to lengthen out this Report unnecessarily, we shall simply mention the objects thus noticed: BLOCK OF SERPENTINE (p. 113), from the Lizard Rock, Cornwall, Exhibit (Outside, West, 1), Exhibited by Mr. Junn Ongan, of Penzance

SLATER (p. 114). Exhibited by the OLD DELABOLE SLATE COMPANY (Outside, 8), and by Mr. T. STIBLING, jun., of Lambeth (Outside, 9). jun., of Lambern Contoure, 2).

Specimen of Anthracitz (pp. 115, 116), weighing several hundred weights, from Cwmllya-fell in the Swansen Valley, South Wales. Exhibited by Messrs, James and

Acmusy (Outside, 37). Specimens of Anthracttic Coal (p. 147), from Gwendracth, Lianelly, South Wales. Exhibited by A. WATNEY

(p. 276). This coal is estitled to notice, from the fact of its being the coal selected for the use of the boilers in the Machinery Department of the Exhibition.

Marniles of Ireland. Exhibited by Mr. P. L. Frank-

LIN (Outside, 28, p. 115), and Mr. MANDERSON (148, p. 136).

Taissi Stones employed in decorative sculpture. Con-nicus and other objects manufactured of them. Exhi-hited by Mr. J. C. E. Lono (78, p. 129). Punners Mannie, from the Woodyhide Quarries, used in decorative architecture. Exhibited by Mr. J. Voss

(135, p. 135).
Collection of BUILDING MATERIALS, from the county of Scher (152, p. 136).
PORPHYNY, described as ELVAN STONE, from the arries of New Quay, in Cornwall. Exhibited by Mr. JOHN NICHOLLS (162, p. 137).

Very fine EMERALDS, in the veinstone. From the Muso Mine, in New Granada. Exhibited by Mr. J. Nelson BONITTO (4, p. 120). Collection of Ores of Copper, Lead, and Argen-Therway Lead, from various mines in Pertheshiae, Exhibited by the Marquis of Breadalbane (7, p. 120).

The specimens from the Tyudrum Mines are remarkable for their large size, and for the beauty of the crystals of galeus, which form the principal mass. The Marquis of Breadalbune, the owner of these mines, has added to the ores, specimens containing rocks and various minerals that accompany them. This interesting collection offers, therefore, an almost complete history of the lend and copper veins of Perthshire. pecimens of JET from WHITBY, in YORKSHIRE (11.

p. 121).

The jet of Whithy, specimens of which are exhibited by Messrs. SLATER and WRIGHT, forms part of a thick bed of lignite found there in the upper lias morts. It differs in this respect essentially from the jet worked in France and Spain, which is found in irregular veins in the lower marls of the cretaceous series corresponding with the gunlt of Sussex,

Collection from the Salt Mines of Chesaure, with the products, as purified. Exhibited by Mr. W. Wontming-TON, of Northwich (57, p. 127).

Collection of different kinds of Soria, from the neigh

bonrisod of Newbury, in Berkshire (60, p. 127). The town of Newbury is situated in a basin of lower tertiary beds reposing directly on the chalk. The nature tertiary betas repossing directly on the chair. The nature of the soil is greatly varied by the mixture of London clay, plastic clay, and sand, associated together. The collection, exhibited by Mr. J. W. Roaks, possesses an agricultural importance which is recognized by the Jury. Collection of Saxbas from Conswala, employed for building or agricultural purposes. Exhibited by Cuptain Rouse and N. Whitler, Esq., of Truro (79, p. 130). Fine and coarse Pottery Clay, from the Isle of

Persecution to the control of the co high celebrity, which the Great Exhibition has brought into yet more prominent notice. A plastic clay is used in the manufacture, which forms thick beds in the small peninsula called Purbeck Island; Messrs, W. and J. Pikk, the proprietors and workers of these pits, have exhibited samples of different qualities of the clays, especially those adapted for fine carthenware, stone ware, and drainage

pipes.
Carcunius for metallurgic purposes (118, p. 133), exhibited by S. Asstrey.

These erucibles are employed by copper and brassfounders. Long experience has proved their excellence of mannfacture, and the quality of the clay of which they are made.

MATERIALS used in the mannfacture of POTERN and

GLASS, from the county of Coars, INELAND (12), p. 153),
Mr. J. DESSINO, Of Middleton, has exhibited a collection of clays from the Rostellas pits, of which he is the
porprietor. These clays are employed, according to their
quality, in the manufacture of porcelain, fine pottery, and
term cotta. Other materials found in the same place are
much used in the manufacture of glass.

nach ased in the mannfacture of glass. Buttish Colonies and Dependencies.

The East India Company has exhibited a collection of minerals and rocks, consisting of about 450 specimens, most of them belonging to erystalline formations.

We have, however, noticed amongst these marbles, which have every appearance of being of the palecozoic age, some specimens of tertiary rocks: there also exists coal of good quality.

It is to be regreted that the labels accompanying these specimens contain no information as to their relative position, while the muses of the localities are fur the that great difficulties are in the way although the conmake out their geographical locality. It would be very make out their geographical locality. It would be very arrangement of this collection to some one who knows the spots where the specimens were collected, as it would hen become of "prest value for the study" of the geology

With the exception of the tin ores of Malacca, and some sulphurets of antimony, and several specimens of ochre, also from Malacca, the various mineral products of India are not even indicated in the Official Cotalogue; but the Jury have satisfied themselves that the collection contains several objects of much interest. They have noticed especially the iron and steel of Salem, a district in the presidency of Madras, whence a carefully-selected series has been seut, including not only the ores, but the roducts obtained in the various stages of manufacture. The Jury have awarded a Prize Medal to the Indian Inon and STEEL COMPANY (pp. 860-869), for this collec-tion, and have also awarded to the Honoranne East INDIA COMPANY (pp. 868, 869) Honourable Mentions for tin working (Singapore Committee), for specimens of conl, and for the treatment of antimony, the latter process being represented by specimens of the sulphuret of autimony, and of the antimony in the metallic state.

The collection that illustrates the methods of iron and steel working shows that two distinct operations are involved-the formation of blooms or lumps weighing at most 22 lbs., and the refining, or rather forging, these into flat bars from ten inches to a foot long. This iron is nlways steel-like, some bars being truc steel. The work resembles that of the Catalonian forges, except that it is on so small a scale, and the process might be partly understood by considering the size of the blooms; but additional proof is obtained as to this mode of working, since we find in the Indian Collection a series of models executed in the country, of a considerable number of industrial processes, amongst which is one of the forges of Salem. By looking at this model a sufficient idea may be obtained as to the nature of the iron manufacture. The forges appear to be temporary establishments,

The ergos appear on the employer, estimation and an another. The hearth, hollawed out at the bottom, is round, and may be about 18 to 20 inches in diameter; it is surrounded by a rim of each about aix inches high, in its arrounded by a rim of each about aix inches high, in the state of the contract of

bloom is obtained. Two hlacksmiths, with a man to work the bellows, complete the number of those employed in one of these little establishments, and the forging is done cutirely by hand. The ore, which is principally a metalloid form of the kind called oligist, is broken into small fragments, none of them larger than a walnut, and

few larger than a basel nut, before it is smelted.
The collection also includes buttons of cast-steel from 2 to 2½ inches in dismeter; this material being the Work. The collection is limited by the preparation of Damascus blades. There is nothing to show directly in what way they have been prepared, but it is impossible to doubt from their form that they have been obtained in small crucibles.

The specimens of tin ore are all water-worn pebbles, and it is therefore very probable that the mining operations in Malacea are confined to stream works. We may conclude that there are very extensive deposits of such nees in this part of India, since a large quantity of tin is

exported.
The coal exhibited is from four localities, which belong to two distinct deposits. One of there is situated south the coal to be a second of the coal to be a second of the coal to be a second of the coal to be seen exposing out in the valley of the Soon event, which empire itself into the Ganges a little above Patan the other is in the valley of Damosold, empiring itself which is of very good quality, is in cubical lumps about 18 inches a side; the other, exhibited by H. H. MARUNDO (p. 861), belongs to a bed fine fleet thick, the position of which in the coal measures will be understood by the

Mr. Williams, who long occupied the post of geological surveyor to the East India Conspany, drew up a very interesting geological report on the valley of Dannoodah, in which some details of the carboniferous leasin of the valley are given. Of this deposit, which is likely soon to have an important influence on the industrial progress of India, we willingly give a short notice.

The coal basin of the valley of Damoodah is situated in longitude 82 kg, and in Intitute 22 kg. Ne Recommences a little west of the point where the Barkust flow on the property of the point where the Barkust flow to lespons adong the valley. Towards the north it reaches as far as the river Adjl, on whose banks the coal formation is seen outeropping for a distance of mywards at 25 miles. It is included between the town of Nagore other to the south of the valley of Damoodah.

The coal measures rest on crystalline and metamorphic rocks, coasting of disrite, guess, and mice schist. In the hills to the north on which the actual contact is seen, there are also aclose achists with tourmaine, and schistosochlorites with magnetic iron ore. Towards the east the beds are covered up by a ferruginous sand, which is an extension af the alluvium of the plains of the Ganges. Extensive researches have been made by the Bengal

Coal Company, and by Measrs, Enskine and Co. The latter have explored chiefly in the neighbourhood of Bucktennaggru and Mangulpore, and have made known the existence of five beds of coal having a total thickness of 22 feet, as seen in the following shaft-section of one of their pits:—

The copper ores from Australia are strictly analogous to those from the Oural; they occar in nodules disseminated in a slightly coherent sandstone or ochrey elay, and the surface of the nodules is studded over with crystals, the intercises between which are filled with clay or sand.

the surface of the nodales is studied over with crystals, the intervises between which are filled with clayor sand. Some of the nodales are of large stay; one of them in the Barra-Barra collection measuring §§ left by f feet inperfetal, with a thickness of 6 inches. In the specimen the nodal content of the same metal forming an attention and his exchanges of the same metal forming an attention conting; but the three minerals are not superimposed in more, the red calculation of the same metal legality in the cuttre, sending out shoots in every direction. A fittin antire copyer also occurs with the coldic.

The reporter has observed with some surprise prospants and chlaride of copper among the specimens exhibited by the Burra-Burra Company (3, p. 991). These cupricerons combinations, which are chiefly found in Corawall and Chili, usually ocour in veins, which suggest the query

as to whether there are in Australia both kis ds of copper ground, ar whether these specimens are accidentally mixed. The labels do not enable us to reply to this query, which is of some geological interest.

source of the control of colors of the control of t

appears to have been the subject of a serious geological study. Eight persons have exhibited ones which are the result of their explorations, and some of the ones are already the object to fpractical workings. We may particularly refer to the coal of Walkato, and the copper misses

of Kawaii.

The Jury have awarded an Ordinary Mention to the

different exhibitors whose names we proceed to quote in the order of the Catalogue. Haronkayus, Mr. J. (8, p. 1001). Lignite worked on the banks of the Tamski river, New Zealand, Judging

the banks of the Tamaki river, New Zealand, Judging from the specimens, this lignite exhibits a passage to cannel coal, and it is stated that the bed is 5 feet thick, GREENWOOD, Mr. W. (9, p. 1001). Coal and building stone; the last-named are referred to in the Catalogue as No. 17.

Connet, Mr. (10, p. 1001). This exhibitor represents the Auckland and Waikato Coal Company (of which he is secretary), who have exhibited specimens of coal from the Waikato mines.

TAYLOR, Mr. J. (11, p. 1001). Geological series from the copper mines of Kawaii. REEVE, Mr. J. (12, p. 1001). Specimens of enpriferous

RENES, Mr. J. (12, p. 1001). Specimens of capriferous pyrites and blue carbonate of copper, from the mines called Whitsker and Heale's near Kawaii. Lawas, Mr. T. (13, p. 1001). Specimens of copper ores

I Liwis, Mr. T. (13, p. 1001). Specimens of copper ores from the mines called Great Barriar Island Mines, situated 35 miles N. N.E. of Auckland.

Surru, Mr. J. A. (14, p. 1001). Specimens from Brothe's neopper mines, nitotated 100 miles north of Auckland. The same exhibitor has also shown sulphur from White Island, in Plant. Mey. and somehous of a service process instrument.

same exhibitor has also shown sulphur from White Island, in Plenty Hay; and samples of an argillaccous linestone, adapted for the masufacture of Roman cement (19, p. 1001).

MEZHANG, Mr. E. (18, p. 1001). Pumice-stone from the banks of the river Wakkato.

the banks of the river wasking.

The Cape or Goon Hope (p. 949) has sent fine specimens of galena, worked at the Maitland mines at Port St, Elizabeth. It also exhibits graphite from Cape Town, and iron ores from Uttenhage.

Of all the Birdin colonies CALARA [p. 997] is that below calculated in the most careerings and the most careering with the most careering with the most careering with the contribution of the mineral kingdom is concurred, to all countries that the colonies of the mineral kingdom is concurred, to all countries that the fine of the colonies of the col

nical, includes eight divisions, via.:—

Metalliferous minerals, and metals obtained from
them.

Minerals which require complicated operations to render them fit for use, Lithographic limestones and minerals employed in

jewellery, and in the manufacture of glass of various Various kinds of clays, and refractory clays.

Rocks furnishing whetstones, hones, and polishing

Rocks and minerals in use for improving soils. Materials used in construction, and rocks serving for architecteral decoration,

Combustible materials. All these classes include materials of great interest for industrial purposes, and we think it useful to mention some more specially. The ores of iron require notice first of all for their abundance and excellent quality, as the nagnetie oxide is worked in upwards of ten different

The mines of Marmorn, the most important of all, are situated in the west of Canada, and are worked in a mass of ore more than 100 feet thick. The magnetic ores obtained from them (4, p. 961) are accompanied by pig and bar iron from the works established on the spot, and belonging to the Marmora IRON COMPANY. The Jury has recognised the good quality of their products by making Honournibe Mention of this Company; and the same is awarded to Dr. J. Wilson (2, p. 961), who has exhibited magnetic iron ores from South Sherbroke, and phosphate of lime from Burgess.

Ordinary Mention has also been made to Mr. LANCASTER Orumary accusion has also been made to Mr. LANCASTEM Of VADBROUL (6, p. 961), Captain Monta of St, Vallier (9, p. 961), Mesers, L. SEGR of St. Eustache (16, p. 961), E. Carnos of St. Aus. Montimoreouy (19, p. 962), G. Deusaniza of Murray Bay (21, p. 962), and R. W. Killier of Gaspé (22, p. 862), who have exhibited ores of iron of

different kinds

Massive hydrous exide of iron is an important mineral amongst the iron ores of Chunda, and is worked in large masses in several localities. We may mention, particularly, that of St. Maurice, which for more than half a century has supplied the iron works and foundries of that name. The Honourable J. Franker, the proprietor of the mines whose products are exhibited in No. 5, p. 961, has added to the ores specimens of pig and other iron, besides slags and ashes obtained during the working of the ores.

The iron from St. Maurice is of good quality, and the products exhibited show that this establishment proceeds with regularity, in a metallurgical point of view: these usiderations have induced the Jury to award a Prize

Medal to the proprietor

The exhibition of Canada includes the ores of zine, lead, and copper, from several localities. The ores of copper from Lake Superior and Lake Huron are remark-Inde for their richness, and that called 'Bruce Mine,' on Lake Haron, has been worked for some years. The Minino Company of Montrical (the proprietors of this mine) have erected an establishment for working the ores on the spot, according to the methods adopted at Swansea, and the objects sent by this Company (10, p. 961), exhibit, by the side of the ores, the various products of smelting, by the sate of the cree, at these process of smering, besides the specimens of black and refined copper. Specimens of copper and native silver, from the Island of St. Ignatius, on Loke Superior, are added to these, and the Jury has awarded to the Company a Prize Medal for these one objects.

The existence of spangles and pepites of gold has been proved, by actual investigation, in several rivers of the east of Canada, and Honourable Mention is made of the CHAUDIERE MINING COMPANY (12, p. 961), who exhibit pepites of native gold collected in the washing those streams. Messrs. Borpoin and Lerank (15, p. 961) are also streams. Messes, Roudon and Lerank (15, p. 961) are also rewarded with n Mention for the white quartzose sands which they exhibit, which are used with advantage in the manufacture of flint and crown glass.

The last award that we have to mention in the case of Canada, is the Honourable Mention adjudged to Mr. Logan (1, p.958), who has exhibited iron ores, lithographic stones, minerals, and various rocks. Our colleague has not thought it right to add to these the geological sump he has made of Canada, a matter which the Jury greatly

regret, not because they would then have been able to adjudge a higher reward for this beautiful work,—for the position of Mr. Logan, as member of the Jary, would render this impossible, -but because of the great interest it would have udded to the Canada exhibition.

The lithographic stones exhibited by Mr. Logan (1, 958) belong to a palmozoic rock, occurring at Marmora. where the unguetic iron ore has been mentioned as forming n deposit of enormous thickness. These stones are remarkably homogeneous and fine grained; the degree of finish of the drawings that Mr. Logan has caused to be made upon them giving every promise of the quality being good. The geological position of the stones is interesting, and the reporter is not aware of such material having been previously found in the old rocks, since, up to the present time, these who practise lithography seek for stones from rocks of the solitie series. The discovery of Mr. Logan, proving that the palacozoic rocks may also furnish good lithographic stones, increases the resources available for this important bruneh of engraving and

We must also notice, amongst the articles exhibited by Mr. Logan, a cast of the footsteps of un animal discovere in one of the argillaceous schists of the palgozoic period. When this schist was first laid hare to a certain extent. Whole this school was instituted to a consideration of footsteps repeated several times, and he lind the upper bed removed to satisfy himself as to whether they were continued. Their existence, under these circumstances, fully proves that the markings were made at the time of deposit of the bed, and thus entries book the existence of quadrupedal animals to the earliest Silurian epoch. The length of the animals to the earnest couragn epoch. The reagon of one track discovered is eight feet, and as many as twenty impressions of each foot are traceable. Besides these is an impression between the footmarks, which may be regarded as the trail either of the abdomen or the tail of

the animal. It would carry us boyond the proper limits of this Report if we were to give even a sketch of the geology of Canada, and those who wish to become acquainted with the subject must be referred to the Report for the years 1848-49 and 1849-50, addressed by Mr. Logan to the Governor-General of Canada, and published by order of the Legislative Assembly of the colony. We must, how-ever, mention the presence of phosphate of lime and gypsum; the former disseminated in large prismatic erystals in the metamorphic limestones occurring in thick beds at Burgess, while the gypsum is found in many localities forming large irregular masses, intercalated in the upper members of the Silurian series, especially at Oneido Scucca, on the Grand River. This gypsum has an even fracture, is foliaccous, and of a fine white colour, and being very pure, may be used for the manufacture of

plaster for easting.

New Baunawick and Nova Scotta (pp. 969, 970), which are only separated from Canada by the River St. Lawrence, possess a similar geological structure, and the mineral productions are identical. The first of these colonies is only represented by some specimens of lignite and asphalte, recently discovered on the shores of the Peticodiac. There are, on the other hand, two rather interesting collections from Nova Scotin, one (3) exhi-hited by the Central Committee of the colony, the other by Mr. S. D. ABCHIBALD, F.R.S. (2, p. 970). The Jur-has awarded a Prize Medal to the Committee, its collec-The Jury tion including the whole geology of the colony, and offering a more general interest than that of Mr. Archibald. In the latter collection (2), the object has been to illustrate the resources of New Bronswick, with regard to the manufacture of iron and steel by means of char-coal fuel; and for this purpose Mr. Archibald has added to the specimens of magnetic and specular iron, which exist in thick masses, pig iron, wrought iron, and steel ande from them, lossides many manufactured objects worked at Sheffold, to prove the excellent quality of the irou and steel of the colony. The Jury has granted a Prize Medal to Mr. ABCHUBALD likewise.

In the collection of the Nova Scotia Committee, we may notice very good specimens of sulphate of barytes, ores of manganese, coal in large blocks, having all the characteristics of bituminous coal, and ores of iron and copper. There are also blocks of bluish gypsum, of even fracture, and several basaltic minerals, especially stillite,

chabasic, apophyllite, healandite, and mesotype.

The gypsum exists in several localities, grouped, for the most part, round the large inland bay called "Mines Bisin," which communicates with the Bay of Fundy by a small strait. Numerous quarries are opened where this gyponm is worked in the south of the Bay, near Fal-mouth, Windsor, and Couept, and in the north in the county of Cumberland, near Tower Hill, the material being exported to the United States, where it is chiefly employed as a mineral manare. The gyps-cous masses in Nova Scotia, as in Canada, are interculated in the paleo-zoic rocks, and are chiefly found associated with beds of

sandstone in this formation The coal appears to form two distinct basins, one at the northern extremity of the county of Cumberland, and on the shores of Chignecto Bay, and the other in the Picton district, near the town of Egerton. The latter is Scotia collection are from it. They are accompanied by numerous vegetable impressions, especially of 'Lepidodeudron elegans,' but there are also sigillarize more than two feet in dinneter, one specimen of which is very remarkable, an account of the arrangement observable in the roots. This has been the subject of special description by Mr. Richard Browo, according to whose investigations it appears that this trunk of the sigillaria was erect, and penetrated several strata. This remarkable arrangement, quoted in support of that theory of the origin of coal which supposes it to be due to an accumulation of vegetable matter is sits is not, however, a solitary example, as Mr. Jackson, in his valuable work on Nova Scotiat says,

they are invariably found traversing one or more of the strata at right angles with its layers The ores of iron are in the state of magnetic oxide, red harmatite, and oligist in compact masses. The human tite appears to form a considerable mass, in which the ore presents the various peculiarities common to concre-

tions; some are remarkable as containing crystals of arragonite in geodes occupying the centre, while in the same deposit sulplant of barytes occurs in tabular white crystals, connected at the base, and forming sometimes considerable masses. Occasionally, also, ores of manganese occur in radiated lumps, of a grey metallic appearance, without apparent crystals, the strenk and other characters

connecting the ores with pyrolusite. Among the ores of iron we noticed particularly the

massive oligist, which is studded with a multitude of fossils of spirifers, &c., and which is a palerozoic deposit in this state. It is more than 16 feet thick, and quite continuous, as, according to Mr. Jackson, it is seen at the eastern extremity of the Picton district, and ranges westwards as far as Anzapolis; the specimens in the Exhibition, one of which is almost enhical, measuring 2 feet on each side, being from the latter place. In this deposit, so remarkable for its richness and extent (ranging for upwards of 100 miles), the ferruginous bed is not constantly traceable at the surface, having only been noticed from place to place at intervals, but the red colour of the soil, prace to prace at intervals, but the red colour of the soil, and the regularity of the stratification, reader it highly probable that the bed of ore is continuous. It is intercalated among shales of the palmosoic period, traversing Nova Scotia in a direction bearing N. 60 E., with a remarkable regularity. The dip, which is about 50° to 60° towards

the north, is equally constant.

The ISLAND OF TRINIDAD is the last of the British Dependeucies to be mentioned in this Report. The Governor, Loan Hanns, has exhibited (1 to 35, p. 972) a series of useful minerals, which sither have been the object of research or are now worked. They consist of ancient rocks, yielding good building material, and the following minerals, viz., magnetic iron ore, hematitic iron, yellow ochres, pyrites which exist in sufficient shundance to be employed in the manufacture of sulphur, and lastly bitumen.

Quarterly Geol. Journal, for 1849, vol. v. page 539,
 † "Mineralogy and Geology of Nova Scotia," by Chr T. Jackson and Francis Alger, page 70.

latter mineral is collected on the surface of a lake, around which are extinct and active volcanoes, and is represented by a collection of specimens of bitmmen of various degrees of parity. The Jury has awarded an Honourable Mention to Load Haants, as an acknowledgment of his interesting exhibition of the geology of Trinidad.

UNITED STATES OF AMERICA.

The geological works that have been published on the United States, among which must be mentioned as of the first importance the Reports addressed by several distingnished scientific tuen to different legislative assemblica of the Union, have satisfied as that this part of North America is destined to occupy an important place in the levelopment of mineral industry.*

It results from these Reports, that magnetic iron ore and specular iron ore or oligist occur in many states of the Union in an abandance not in any way inferior to that of Sweden. In America, also, as in Northern Europe, forests exist almost autouched, which will provide for centuries the fuel required to supply numerous iron-making establish-ments. The immense blocks of native copper discovered

in the trup formations of Lake Superior exhibit a degree of richness surpassing that of all known ores; and if the working of these remarkable deposits confirms the expectation raised by the investigations and researches carried on for some years under the direction of Mr. Jackson, Michigan will soon become one of the richest metalliferons districts in the world.

The exhibition from the United States does not, howver, completely illustrate these sources of wealth, for we find them represented by only four iron-works, one manufactory of zinc, and some isolated specimens from iron nines in the states of Penrsylvania, New Jersey, Massachusetts, New York, and New Hampshire. We may add to these some fine blocks of anthracite from Pennsylvania, and the ores of copper from Lake Superior, one specimen of which weighs 2,544 lbs. The iron exhibited by these different establishments is

f excellent quality, and reminds one of the soft iron of Berry, and the iron so highly valued from Sweden. regret not to have been able to procure any information, either as to the quantity of iron produced annually in these works, or the mode of manufacture. We know that the operations are carried on for the most part with charcoal fiel.†

The series exhibited by three of these establishments are nearly identical, and the Jury have not been able to distinguish any superiority between them. A Prize Medal has therefore been granled to each, viz.:-

Messrs. Morris, Jones, and Co, Philadelphia, Pennsylvania (44, p. 1435).
TRENTON IRON CUMPANY, at Treaton, New Jersey

167, p. 1448).
ADIRONDAC MANUFACTURING COMPANY. New York 344, p. 1456).

Mr. Hitchcock.

† The annual make of Iron in the United States is esti-

y 1 ha samma make or iron at the thirted States is estimated at 400,000 tons. This quantity is the produce of about 298 Guraces, which are in constant eperation, the low price of foreign (chelly English) iron in the market baving thrown exerts out of blast. Of these 298—35 are authorselfe furnance, and make 20 tons each per compared to the product of the produc

week (average); 7 are bituminous coal formsees, and make 22 tens each

4 are coke furnaces, and make 48 tons each per week; 85 are charcoal turnaces (hot-blast), and make 21 tons each per week;

145 are charcoal furnsecs (cold-blast), and make 14 tens each per week,

The objects exhibited consist of iron ore, slags, pig iron, and different specimens of iron. The Admudae Company has also added manufactured iron and bors of steel, remarkable for the delicacy and evenness of the grain. The Treaton Iron Company has exhibited iron and iron wire of different numbers. One of these, of extreme delicacy, is also oot less remarkable for the

The exhibition from the iron-works (202, p. 1450), belonging to Messys. Morrill, Stewart, and Co., of Cincinnati, in the state of O.io, is less complete, containing neither ones nor pig iron, which makes it probable that this Company has not exceted smelting formaces, sheet iron produced by them is of good quality, but the difference we have mentioned has induced the Jury to limit their acknowledgment to an Honourable Mention.

The ores which supply these several works consist chiely of magnetic uxide, ofigist, and spothic iron. dimensions of the blocks of ore, and especially of the spathic iron, which are upwards of 20 inches a side, afford satisfactory proof of the riebes of the deposit: and with regard to some particular localities, we have descriptions which seem to show the presence of ores even on a larger scale than in Sweden and Elba, and where the magnetic oxide and oligist appear to have been erapted.

According to the description of Mr. Emmons,* the mass of magnetic ore which sapplies the works at Adirondae is the most remarkable of all for its thickness and extent. It would seem to occupy, at the height of Lako Henderson, the whole of the valley of Adirondae for more thna 15 miles in length, reappearing on the shores of Lake Sandford, and having a range of more than eight miles. In each of these localities there is a band of magnetic iron ore more than a mile wide, not stratified, but forming three distinct veins, manifested by differences of grain, and even by the quality of the iron made from each, without the chemical composition indicating any distinction. Often these veius are cut by others of a different kind; just as we sometimes see voins of large-grained granite peactrating masses of fine-grained rock of the

It is an interesting fact, and one we feel it right to mention, because it may to a certain extent throw light on the caases which determine ores of a similar auture yield iron of various qualities, that in the Adirundae mines, a contact with trap rock is observable. Mr. Emmons states that, "when the mass of ora is intersected by a tens dyke, its appearance is more erystalline, the reduction of the ore is a slower operation, and the iron obtained is hard and difficult to work."

A Prize Medal is also given to the New Jersey Ex-ptoming and Mixing Company, the sent of whose operations is nt Newark in New Jersey, and which has exhibited (166, p. 1447) sine obtained from "franklinite," and some fine crystals of this mineral. The composition of franklinite, which is oxide of zine combined with oxide of mangauose, probably requires a different treatment from that pursoed in Belgiam, Silesia, and England, to obtain metallic sinc. We should have been glad to learn obtain metatre and. The should have not able to obtain any information on the subject, arither were we able to obtain a specimen of it, which we wished to possess in order to repeat the analysis made by M. Berthier on speeimens mixed with magnetic iron ore and veinstone.

Honourable Mention has been awarded to seven exhibltors, whom we shall meation in the order of their insertion in the Catalogue.

Mr. C. W. PEALE, of Hicksherville, in Pennsylvania (74, p. 1498), for very flac specimens of anthracite, and the accompanying rocks. These specimens agree with an interesting description given of the mines of Peonsylvania, I place this feel among the earboniferons series.
Mr. W. Darling, of Reading, in Pennsylvania (19),

p. 1449), for iron ores and metallic iron. Mr. A. J. Roussnau, of Troy, New York (314, p. 1454), for iron ores.

* Geology of New York," Part II., by Mr. Emmons, Professor of Natural History, at Williams College, p. 246

Mesers, W. and J. W. Waro, of Boston, Massachusetts

408, p. 1462, for specimens of copper ore.

Mr. G. H. Rugglars, also of Boston (416, p. 1462, for sheets of mich of very large size, used for the doors of stoves, as being transparent and ullowing the fire to be seen through them. The construction of the stoves is such, that the heat, which is probably enried to the back of the fire. does not attack the mica, and it often lasts several years

Dr. FEUCHTWANGER 469, p. 1464), of New York, for a collection of minerals, fassils, and fresh-water shells, col-lected in America, In this large series of speciment, which are in rather a bad state of preservation, perhaps occasioned by their transport to Europe, there are several rare minerals, especially xonlites from trappean rocks, There are also cystalline diamonds, some fine topazes, and specimens of native copper and silver. The mass of pative recommens as sattree opper and silver. The mass of native copper from Lake Superior, mentioned at the beginning of this account of the United States products, and weighing 2,544 lbs., belongs to this Exhibitor, and beans marks of the ebisel which prove it to have been part of a still larger piece. It will be seen, indeed, from the brief notice here salijoined on the deposit of native copper in Lake Superior and the life Royale, that masses have been extracted whose weight execeds 10 tons.

Deposit of Copper on the Shores of Lake Superior.

The poculiar nature of the deposit of copper in the state of Michigan, and the inflaence that this discovery may have on the production of that metal, have induced the Reporter to give some details on this inportant fact in relation to the mineral industry of the United States, They are extracted from the interesting Report published by Mr. Jackson," on the researches that have been instituted to make known the circumstances of this deposit, and the well-founded expectations to which it gives rise. We must first remind the reader, that the discovery of

empper on the shores of Lake Superior is not so recent as is generally imagined, as it dates from very shortly after the establishment of the French in Canada; and if at that period it led to no results, the reason was that the countr being then occupied exclusively by the Indians, was little themselves were concerned, very ancient superstitions prevented them from making any long stay at Keweenaw Point, where the existence of the native copper was first

determined.

The untiquity of this discovery is attested in a work published in Paris in 1636, by M. Logarde, who states that M. Truebesaoat Bruslé had given him an ingot of copper, obtained 100 lengues west of Lake Huron, second notice of the existence of a mass of copper in this part of America is given in the account published in 1666, by Futher Claude Allonez, of the Mission of tho Holy Ghost ot Outaonoes, in Lake Tracy or Superior, the there states (chap, ii., p. 32; that copper exists in abundance on the south shores of this lake, at 50 or 60 leagues beyond the Leap of St. Mury, on the other side of the place called Missipiconatong.

is clear from later publications, that the trace of

this discovery was never lost, and several travellers, amongst whom may be mentioned General Cass, have personally verified its correctness. But the first scientifie researches commenced only in 1842, and were made by Dr. Douglass Hongbton, attached to the government of the state of Michigan as geological surveyor, but who died on the coast at Kewcenaw Point before his observatious were published. The details that we have at present concerning the deposit are due to Mr. Jackson. who has made a detailed study of the district

According to the description given by this distinguished geologist, the native copper exists on the shores of Lake

* "Geological and Mineralogical Reports," by Mr. Charles Jackson, November 1813.

Superior in two distinct deposits, one towards the northern extremity of the state of Michigan at Keweenaw northern extrusity of the state of Michigan at Newceaux Point, which firms a projecting bendland Inwards the middle of the south shore of Lake Superior, and tio-other in Jake Royale, sinanted in the lake, about 50 miles north of Kewenav Point. This island, which ranges tortheast and south-west, lies exactly parallel to Cape Keweenaw, and to the strike of the beds of which it is composed. It presents also a geological construction identical with that of the shores of the lake. The two deposits occur in the same formation, and nader circumstauces precisely similar.

Mr. Jackson's geological map shows that the Michigan shore of the lake consists of granite, trappean rock, and red sandstone belonging to the lower Silurian series, The trap, like that of Scotland, is composed, according to Mr. Juckson, of an aggregate of crystals of horableade and feld-par, mingled with erystals of magnetic iron ore. There are also found, occasionally, presite, datolite,

lanmontite, chlorite, and lanimated cale-spar. The sandstone and trap form parallel bands, running due north-east and south-west. At Cupe Keweenaw the sandstone is seen to the right, and the trap to the left, At Isle Royals the south shore is the only one on which the saudstono can be traced, so that from this arrangement the trap would seem to form two parallel hands. separation of the sandstone and trap is marked by a conglomerate, called by Mr. Jackson, trap-tnff, which consists of fragments of sandstone, compact trup, melted trup, umvedaloid, and sometimes pebbles of old rocks. In many localities, especially at Eagle River, this conglomerate is of considerable thickness, and has been falsely regarded as belonging to the palmozoic epoch. Near the junction the trap is anaygdaloidal, and seems to have undergone a certain modification of texture at its contact with the sandstone. The cavities are filled with chlorine. agates, laumontite, pectolite, and laminated calc-spar, in small concretionary nodules, the size of which varies from that of a grain of millet to a musket-ball. The surface of the included cale-spar and agate is covered by a film of chlorite, so that when first removed they look like small nodules of chlorite, and their true nature can only be determined by breaking them. It has been noticed in the course of the operations carried on by tha Lake Superior Company, that when the envities were filled with chlorite nodules, "there was always a grain of copper in the centre. Elsewhere, and near the veins of copper, the included minerals in the same amyedaloid

Native copper and silver are found at Cape Keweenaw and Isle Royale only in the trap formation, all the important veins forming together a narrow zone in the amygdaloid. When a vein of copper penetrates the trap once thins out, and only affords a thin film not The sandstone and conglomerate form worth working. also another limit of the metalliferous band, and when the veins do not terminate at the contact of the sandstone. the part extending into this rock is filled with cale-spar instead of copper. It hence results that the thickness of the amygdaloulal band intervening between the trap itself and the sandstone becomes the limit of the cupriferous veins, and this thickness rarely exceeds 2,000 feet. The depth of the veins is unknown, but Mr. Jackson imagines that they extend below the saudstone.

were occupied by copper or native silver, or by these two metals at once."

At Keweenaw Point the espriferous zone may be about 120 miles in length; and in 1-le Royale it ranges through the whole extent of the island, which is about 45 miles The richer portions are unequally distributed; and Mr. Jackson states that his numerous researches, extending over several years, have made known to him almost all the places where workings may be carried on with advantage.

The trap forming a band in the middle of the sand store, there occur, of course, two amygdaloidal access at the coutact of the rocks. A marked difference is always observed on the two sides, both in the quantity of copper and the state in which it is presented. The difference may, however, have reference to the nature of the trap. Metallie copper is chiefly found in the north zone at

Keweenaw Point, while in the south the copper is in a state of sulphoret. The trap here a a porphyry, consisting of a compact felspathic lane with crystols of felspar. On the small lake called "La Belle Mine" near the extremity of Kewceanw Point, and which belongs to the southern zone, the trap rock is very crys-

talling, and resembles syenite.

We will not follow Mr. Jackron in relating the details of the veins, of which he has explored upwards of a hmdred, merely stating that these veins are generally transverse to the amygdaloidal hand. In Copper-full's mine they take a direction from N, 25° W, to N, 30° W, and S, 25° to 30° E, almost at right angles to the line of separation of the trap and candstone, and the dip is here 70 W. These veius are 18 inches wide, of which metallic cupper occupies at least a fourth part, Mr. Jackson states that he has seen a tures 20 feet long, 9 feet wide, and from 4 to 6 inches thick taken from these mines

The mass weighed about 10 tons.

These masses of large dimensions are not rare, and to give an idea of the richness of the mines as d the expense of working them, Mr. Jackson states in a Report, dated 25th September, 1848, "that the preduce of the mines for one year had been nearly 43 tons (95,994 lbs.) of ore, containing 70 per cest, of metal, or about 30 tons of copper in all. This produce was the result of the labour of 33 men, of whom 20 were miners and the rest labourers. Among the masses of copper obtained from these mines, he mentions four whose respective weights were 7,018, 7,484, 7,678, and 14,000 lbs.

AUSTRIA.

The Exhibition affords but a very imperfect view of the mineral resources and mineral industry of Austria for the working of mines is really very scrively carried on in the different states of this vast empire. The diffirulties we have referred to at the communicement of this Report, and which have prevented so many persons from taking a part in the Exhibition, have been sepecially felin a country whose territory reaches the sea in only a few points, and whose average distance from London in rous industrial occupations earried on in Austria, and referred to the excidention of this Jury, are represented by only 50 exhibitors, 30 of whom are occupied exclu-sively in the production of iron and steel. Of this number again, Carinthia, Styria, and Upper and Lower Austria, have farnished two-thirds, and the mires of copper, mercury, cohult, and nickel in Hungary, those of pyrites in Bohemia, and of assenie in Salzburg, complete the list. Among the objects missing, and of which the absence is most to be regretted, must be mentioned the various methods of mechanical preparation so well nuderstood in Germany. These would have been especially instructive; for ut the present time, when mines formerly abandoned as yielding ores too poor to pay for working are being re-opened in order to draw from their rubbish are being re-opened as the state of the ancients, it is much more by improvement in mechanical preparation that economy can be introduced into these difficult operations, than by any metallurgical processes which have long since been carried to a high degree of perfection. In order to give some interest to the coumeration of the establishments who have obtained Medals or Honourable Mention, as well as to indicate their relative positions. we here give a rapid notice of the principal sources of mineral wealth in Austria.

Almost all the states of the Empire possess important deposits of iron ore, and the abundance of wood has rendered it possible to introduce everywhere numerous establishments for working these ores. Styria, Carinthia, and Lower Austria are the most important districts, and deserve special mention on account of the abandance and quality of the ores as well as for the peculiar methods of manufacture adopted there.

The most common of the ores of iron is the sparry earbonate (spathie iron), which forms very thick beds, intercalated amongst the granwacke and Alpine limestones on the north and south flanks of the axis of the Alps. Of those in the northern district we may mention the deposit

at Erzberg, near Eisenerz, in Styria, which has been celebrated for many centuries, and which has furnished appears of two millions of security, equivalent to Hiefflan, Eisenerz, and Vorderaberg. Other deposits, not far off, supply the adjacent works of Neuberg, Mariazell. &c. On the southern side of the central chain the deposits of spathic iron are equally ahundant, and furnish ores to the works in Carinthia, of which we may mention Lölling, Hüttenberg, and Wolfsberg.

The brown luminities, without being so abundant as the spathic ores, perform a very important part in the production of iron in Austria, and chiefly in the southern districts. In Carinthia they occupy veins and form beds in the granwacke, and in the micuceous schists,

The hydrous oxide of iron, which is a third ore worked abundantly in this country, exists in more modern formsations, or at least in rocks which have been less altered, and have not been subjected to metamorphic action. The principal establishments in the south of Austria are supplied from this ore.

The spathic ores and humatites are well adapted for the manufacture of steel and strong iron. They occur in stances found with them consist of a small quantity of metallic sulphirets, chiefly copper pyrites disseminated in patches amongst the spathie iron. The presence of these sulphurets requires sometimes a careful picking to separate the fragments in which they are most abundant, and also an exposure to atmospheric action, by which they are decomposed. The spathic ores are, however, always roasted before being smelted, partly in order to get rid of any sulphur that they may contain, although the chief ubject of this operation is to decompose the earbonates, and thus render the ore more porous and more easily reduced.

The rapidity with which these ores are smelted is ultimately so great, that more than 20 tons of pig per day are obtained from the furusces at Lölling with an unusually small consumption of charcoal, the proportion heing indeed less than one part of charcoal for one of pig; the result in one case ranging as low as 0.83 charcoal for

I'0 of pie. In Styria are still used occasionally the small Styrian

forges; but the principal establishments have adopted reverberatory formaces for puddling, forging, and other purposes in iron-working. The employment of these reverberatory furmaces is interesting on account of the different kinds of fuel consumed in them: thus at Schlegelmülle, near Glogguitz, they use gases produced in special apparatus; at Neuberg and Wolfsberg, wood, either simply air-dried or baked in ovens, is employed; at Mentern, ueur Loeben in Styria, air-dried turf; and at Prevaly, in Carinthia, lignite. In the further processes of irou-making, and especially

in the manufacture of sheet-iron, the use of turf is com-mon in the Styrian works. We may especially refer to those of the valley of Marz, where we have had the opportunity of observing the operation,

The refining for steel is performed in small Styrian hearths, and the steel thus obtained is of excellent quality. It is indeed only necessary to refer to the Styrian scythes. whose reputation extends over the whole world, as suffi-

cient proof of the excellence of this material. Irou and steel are by no means the only sources of mineral wealth possessed by Austria. In Carinthia, and especially at Raihl and Bleiberg, are mines of lead greatly valued for the remarkable purity of the metal. Hungary, Transylvania, the Bauat, and Bohemia, also

Huggary, Transylvania, the Bouat, and Bonemas, and possess important mines of galena, grey argentiferous copper, tellurium ore, gold and silver, antimony and tin. The mercury mines of ldria in Illyria are almost as rich as those of Almaden in Spain. These two mines thraish nearly the whole of the mercury employed transish nearly the whole of the mercury employed. throughout the world in reducing the ores of silver, and throughout the world in reducing the ores of enver, and other purposes for which this metal is needed.

The copper mines of Agordo, in the Lombardo-Vencian ierritory, must also be mentioned among the

mineral resources of Austria. They are not, at present, in an active state, but everything leads to the conclusion that the deposit is an important one. We must also refer in this enumeration to the salt mines of Transvivania and Wieliczka, edebrated not less for the enormous extent of the excavations than for the thickness of the deposit.

We have just stated, that the Austrian exhibition referred to this Jury, is chiefly remarkable with regard to iron, and we have also observed, that the iron-works being grouped into intural districts determined by the position of the ores and the abundance of forest, the working in iron and steel must necessarily present very similar products. The Jury have thus had some difficulty in the distribution of the rewards, and they have been for the most part guided in their decision by the greater or less care shown by the different proprietors to greater or less care snown by the different proprietors to exhibit their methods of working, and by the elaborate-ness rather than the nature of their products, which are all generally of the finest quality. There is, indeed, only one exception to this, the case of the Baron von Kheppt (424, p. 1031), to whom a Council Medal has been awarded for a sheet iron, called paper iron, of extreme thinness and great strength. This beautiful material, which is altogether peculiar, has been manimously considered by the Jury, as well as by those gentlemen whom they associated with them, as worthy of the highest distinction, details already given at the commencement of the Report on the sheet iron of this Exhibitor have made known the motives for this decision of the Jury, and we only now, therefore, refer to them.

Of the other iron-masters the Jury have more especially distinguished eighteen, to seven of whom Prize Medals have been granted, while the others, whose exhibits were less complete, have been Honourahly exhibits were ress compress, more over aroundary Meutioned. We proceed to speak of each in the order of their occurrence in the Catalogue. The objects exhibited being, for the most part, similar, we only give details where there exist some essential points of difference,

Zos, Widow, Cart, of Tanerburg, in Carniola (405, p. 1030). This exhibitor has added to the iron ores used in her foundry the grey pig for wrought iron, white pig for steel, and the different qualities of iron and steel which she manufactures. She has also sent some manufactured iron, especially uails, and has accompanied these objects by the slags and einder obtained at the different periods of the process,

Most of the products of the Tanerburg works are Most of the products or the language works are exported to Italy, where they are much valued. Till within a few years, there was only a small quantity of iron annufactured at this establishment, but latterly it has much increased. The difficulties experienced in developing an industrial occupation so complicated as that of iron, in a poor country where everything has tu be provided, speak at once in favour of the excellence of the products of these works, and the wise and enlightened spirit which conducts them.

COUNT FERDINAND YON EGGER, of Carinthia (409, 410, 425, p. 1031). The Jury have associated in one notice the products of the works at Lippitzhach, Freibach, and Felstritx in Carinthia, all belonging to the Count you Egger, and exhibited by him. The pig and bar iron are made at Lippitzbach, and the other two establishments are intended for the manufacture of irou and steel. The products exhibited in Nu. 425 include blistered steel, rolled steel, and steel wire.

The puddling and reheating furnaces in these works are supplied with wood fuel, and the work proceeds with great regularity and great economy. The establishments of Count Egger were the first in Austria in which the English arethods were introduced, and they have served as models, their proprietor having, in the most disis money, their proprietor inving, in the most dis-interested manner, permitted them to be copied.

Disputate Depot or how Mixes and Iron Works at

Vienna (408, pp. 1030, 1031).
The Austrian Government possesses several iron and steel works in Styrin, the products of which have been collected and exhibited together under this title. They include-

1. Spathie ores, for the most part passed into the state of hydrous oxide, and vielding an ore of very fine

^{*} The "measure" is equivalent to 56 kilogrammes, or about [234tis.-], W.

 Grey pig, from the foundries of Zell, in Styria, which enjoy a high reputation in the country.
 White pig, from Eisenerz, in Styria, of different qualities, from a finely-propus to a large laminated grain.

4. Specimens of steel, raw, forged, and cast.

5. Slags and einder produced in the various processes of suchting and preparing iron and steel, according to the different ways in which the furnaces are worked.

6. Manufactured iron and steel. We may especially notice here the rails, of whose admirable quality the

the different ways in which the Irrances are worked.

6. Manufactured iron and steel. We may especially notice here the rails, of whose admirable quality the Jury have satisfied themselves, and which afford a fracture remarkable for the homogeneity of the grain.

Toeren, A., of Scheibbs, Lower Austria (411, p. 1031).

Among the unnecesse objects sent by this exhibitor, we specify particularly the bellow rice makes at his foundry. The tubes are of excellent quality, and we learn from Priessor Tussers, the Austrain neurable of the duty, that fees the surface of the surface of the duty, that the manuser in which it is directed, as well as for the excellence of its produce. The work is carried us in a very economical manner, and for 13 years the gases of work or control of the duty of th

operations. CHM-BALEMBERG, Of Murna, in Upper Styria (417, p. 1621). The foundry of Moran is intended for (417, p. 1621). The foundry of Moran is intended for instance of the following state of the followin

following Exhibitors:—
The Comments of Radmeister, at Vordernberg, Skyria (400, p. 1030). A collection of ores, pig free, slags, iron, and steel. The furnaces, which have been recently eularged, are worked with hot blass.
The Paixer Ferseyremeno, Bohemia (412, p. 1031).

The PRINCE FURSTENNERG, Bohemia (412, p. 1031). The products of his foundries in Bohemia, especially the boiler-plate, are all of very excellent quality.

The Count von Bouquot, Kallich, Hohemia (414,

p. 1031). In these works bar iron is obtained from the fuel. The sheet iron, both black and white, appears very fine.

The COUNT G. ANDRASST, of Dernö, Hungary (410, p.

The Count G. Annassa, of Derno, Hungary (415, p.

This Exhibitor receives a Prize Medal in Class XXII., in whose Award List his name appears.—I. W. 1031). In these works the puddling and reliquing of the iron are carried on by the aid of reverberatory furnaces, supplied with the charcoal of brushwood, otherwise of no value. This important modification, which has introduced a great economy in the manufacture of the iron, is not alluded to in the collection of products from the

Dernö foundry.

Fischer, B., of Traisen, Lower Austria (421, p. 1031).
These works chiefly manufacture cast steel; their pro-

a new worse enterty manufacture cast steel; their products are carried into all parts of Germany.

Iliranas, F., of Josefattual, Styris (428, p. 1031). Iron and steel wire of different kinds. The Jury have noticed

and steer wire of uncrent kinds. The Jury have noticed steel wire of very excellent quality, one specimen being remarkable for its extreme finences and great tenneity. SCHEDA, CARL, Wasserluy, Lower Austria (429 p. 1031.) likewise exhibits from wire of fine quality. Onlinear Montion is made of the 641 are

JUST 1, likewise exhibits iron wire of fine quality.

Ordinary Mention is made of the following:

DIPERIAL FOUNDMES OF PILLIBSE AND TENNAGE.

in the Tyrol (407, p. 1059).
FOUNDRY OF THE CHAPTER OF GURK, at St. Magdalenc, Carinthia (416, p. 1031).
STELL WORKS Of Mr. J. PERIFFER, at Spitzenbuch, Styrin (418, p. 1031).

STEEL WORRS OF THE COUNT VON THURN, at Streileben, Schwarzenbach, and Müss, Carinthia (419, p. 1031). Forders of Mr. II. D. Lindheim, at Plan, in Bohemia (422, p. 1031).

Other Metals besides Iron.

Of the whole number of collections which relate to the

production of other metals than iron, the Jury have remarked six as possessing interest from the methods they indicate and the objects they exhibit, each of which has been decored worthy of Honourable Mention. They are as follows:—

INFERIAL ADMINISTRATION OF MINES IN VIENNA (2, p. 1006). For a collection illustrating the processes of obtaining mercury in Idria and lead at Hleyberg, and for extracting sulphur from pyrites at Sworzowiez, in

for extracting surport from pyrites at temperature, in Gallicia, and at Radobo, in Creatia, Szz.mank, J. F., of Neusoh, Hungary (4, p. 1006). Ores of coluit and oickel from Boira, with metallic nickel and cobaltiferous products. This collection illustrates the preparation of nickel, the oxides in Cobalt and nickel.

and the different smalts obtained from cobalt, Kochmeister, F., of Pesth, Hungary (5, p. 1007). Similar products obtained in the preparation of nickel and

combination of cobalt.

Volumeration, G., of Salzburg (13, p. 1007). Preparation of arsenic, of the white oxide of arsenic, and of

yellow and white glass made with this metal. CRENT FERDINAND VON ERWEIN SCHÖNDOM (15, p. 1007), and the PRINCE VON LORKOWITE (16, p. 1007), who have exhibited a fine collection of pyrope garnets, rough and cut.

Minsuacu, A., of Vienna (1, p. 1006), for a collection of lightes from Upper and Lower Austria, Styria, Moravia, and Hungary. These lignites, all of which are worked by the exhibitor, belong to various formations. The are now meth and widely used for many purposes, and

To complete the list of objects in Austria, considered by the Jury worthy of Ordinary Mention, we have still to record those exhibited noder the five following numbers, viz.:—

The Proprietor of the Mine of Zemberg, in Hungary (7, p. 1007), for ores of cobalt and nickel. Hatra, W., of Prague (9, p. 1007), for ores of uranium, nickel, cobalt, and vanadium.

SEZOO, M., of Roseau, in Hungary (10, p. 1007), for ores of antimony and metallic natimony. Hocumenors, J. (14, p. 1007), for the manufacture of sulphate of iron and alum, and the production of sulphur

from pyrites,

Court G. Eggen, of Krappenberg, Carinthia (401,
p. 1030), for a series of crystals of sulphate of baryles.

Велогия (р. 1150).

The mineral industry of Belgiom is represented in the Crystal Palace by 58 exhibitors; but the most important department of all, in d that which has furnished to this country a source of wealth altogether disproportionate to its superficial extent—we mean the working of coal—in the superficial extent—we mean the working of coal—in the superficial extent—we mean the working of coal—in the superficial extent of the superficial extent of the superficial extent of the different rewards granted by the great account of the different rewards granted by the Jury, we shall group them according to the nature of

the products.*

We must first recall attention to the fact that the Conneil Medal has been awarded to the Company of Zinc Muses and Foundries of the Vielle Muntager. The high several production of the Vielle Muntager. The high several products of the world, fully justifies this receptored to all parts of the world, fully justifies this distinction, and we will not here repeat the reasons which have guided the Jury in its judgment, and which we have already stated at the commencement of this

Report:
The first object that has attracted the attention of the Jury is the safety-lump, of which two kinds are exhibited; one by Mathien Louis Musesler, milionity engineer (24, p. 1151), and the other hy Felix Eloin, associate engineer (11, p. 1151).

Long experience has established the advantages of M. Mueseles's lamp, more than twelve thousand of these instruments being at present in use; and we may attribute partly to its adoption the sensible dimination that has taken place in the number of selections from the explosion of carborretted hydrogen gas in those mines, where gas is constantly given off from the coal.

In this lamp, a part of the metallic overeing which arrounds the fine and firms the chimney, is replaced in a constant of the control of the control of the light than that given by the Davy Immp, and which is preferred by the miners; but the essential peculiarity of M. Mucceler's arrangement consists in the mode in which of the control of the control of the control of the informal above, through two wire gauzes at right angles to each other, and afterwards escapes, with the products The chief objection that at first suggests to self-to this

The chief objection that at first suggests itself to this lamp, is the brittlenes of the plans, and on this seconst the Jury for some time hesitated in admitting any marked superiority in it over the Davy lamp. But the Belgian government having commanisated the official reports of experiments made by a special commission, their doubts have vanished, and they have granted a Price Medal to M. MUSSAKEN.

It results from these experiments "that the resistance of the glass has been found to be infinitely superior to that which could be presented by wire gauze, and that in this respect it offers a greater search;; that the instances of fracture have been very rare, and that on so occasion, or resulted in the introduction of the external air to the introduction of the external air to the interior of the lamp. O the other hand, the fragueous of glass have always reminated in their place until the

lamp was opened." The lamp of the provided with a gloss as The lamp of M is because the given it is exceeded to the control, the disperse the rays of light, and diminish a much as possible, the ounsermed induces produced by between this lamp and that of M. Meevler consists of any appropriate for a halling the air out distributing the road of the relation of the fluor. The appearant for a halling the air out distributing the road of the relation of the fluor of the relation of the relation

b This outline is borrowed in great part from a note addressed to the Chalrman of the Jury by M. Gernaert, lugenture on Chef des Muses Beiges, and Member of the lury.

of an inch (18 to 22 millemetres) in diameter, placed about three-eighthas of an inch above the bottom of the wick. This arrangement makes it necessary that the air introduced to feed the thome should post quite close to the wick, which is that, and the cumbustion is thus rendered more active, while the inflammable gas is more

or less coastmed as soon as it enters the Isony.

The Jury have examined with interest the Isony
arbitrated by M. Elois; but as it is at the present tron
submitted by the Belgian government to a special consthat it may possess, they laxe thought it best not that it may possess, they laxe thought it best not to
publish an opinion with regard to it. They thisk it
right, however, to ratte that the experiments made by
or Abertaan, near New port, and of Shipere, in Destry shipe.

have satisfied them of the value of M. Eloin's lump. Munifacture of Iron.

The Jury have awarded six Prize Medals and three Hocoarable Mentions to the Belgian exhibitors in iron. They have been obtained by the following establish-

ments:—cre. F. and A., jron-masters of Acciouse, in the volume of Name (366, b. 165), who have exhibited sigiron made with charcool, and various speciment of iron bearing the mark [JiHH] also mole with charcool. A part of the iron exhibited by this firm is intended for an anather of the properties of the properties of the manashatery of the Belgian governance). Mr. Timmerhans, inspector of weapons for the governance, isocrified in an official document handed to the Jary, that

not a single gun munufactored of this from has burst at the proving-loose, even under the most extreme triol. AMAND, J. tron-muster, of E-medos-sur-Bérce, Namur (368, p. 102). This manufacture resembles that of MM, Moscheur, and part of the iron is also intended for

anking fire-arms.

Onans, J. M., and Sox (372, p. 1162). These exhibitors annufacture iron with coke, and also with charcoal fuel; and besides merchantable iron, they make uso sheet iron and iron wire. It is especially for these latter products that the Jary award the Medal, and they wish to meation particularly—

A piece of rolled coke iron, measuring 1063 feet in length, and half an inch (14 millemetres) in

diameter, and weighing 86 lbs.

Another specimen, only one-fifth inch (6 mille-

metres) in dimmeter, corresponding to No. 4 of the English gauge, measuring 282 feet in leogth, without a joint, and weighing 42 lbs.

A specimen weighing 55 lbs., the length of which is 3751 feet.

and a present parameter time wire, No. 8, seephing 910s., and meaning 1476 for, med of the construction of the electric telegraph. Smillar wire is not received by the Belgian government till a secession of trials prove it to be capable of supporting at least 1,700 h, without breaking, a strength corresponding to 141 lbs, per sq. millemeters (= 301.55 and 161 lbs, per sq. millemeters (= 301.55 and 161 lbs, per sq. millemeters (= 301.55 and 161 lbs, per sq. mill eye, see a consideration of the strength of t

orks, and exhibited by them. Honourable Mention has been awarded to J. Cockebill.

f See an'e p. 3.

of Seraing, Liege (119, p. 1155). The Company has exhibited specimens of pig as d wrought iron, wheel tire for locomotives, manufactured iron, and especially rails This Jury, not taking into consideration the manufactured articles, which it is not their province to judge of, and regarding it as almost certain that the Cockerill Company would obtain honourable distinction for the admirable construction of its unchines, have been guided, in some Mesors, Pinano and Mineus, of Couvin (18, p. 1151).

for their iron ores and bar iron.

The Marcinelae and Coullett Smelting Company (20, p. 1155). The iron which this company exhibits is of very excellent quality; but they are placed in the same entegory as the Cockerill Company, exhibiting machines as well as raw produce.

Zine and Braza Works.

THE NOUVELLE MONTAGNE ZING MINING COMPANY,

at Verviers (7, p. 1151) The exhibition sent by this company includes lend and zine, in pig and manufactured articles in zine, the latter consisting of sheet zine for various uses, such as engraving. smoothing paper, sheathing for ships, zine tiles of different surcounting paper, scenting for supe, and utes of different forms, &c., and sine powder (oxide of sine) for pointing. To illustrate the uses of the different kinds of tiles, the company has added two models of roofs remarkable for

compainly has adocted 14 on mosters of roots remarkable not their lightness. The Jury recognize the great quality of these by awarding the Prize Medal to the company. Catarborn, Messre, Cand II, of Later (377, p. 1198-116), have also obtained a Prize Medal, for boiler-shape 162, competives exhibited by them. These transfers of the competives exhibited by them. drawn and completed without joint, are of very beautiful manafacture.

Terra Cotta, Bricks, Crucibles, Refractors Clavs, and Kaolin. This department of mineral industry is well represented

is the Belgian Exhibition, and has obtained several Honourable Meutions. Notwithstanding the interest belonging to such products, on which the success of some establishments, as of cast steel or glass, may depend, we must be contented with simply naming the Exhibitors as worthy of Honourable Meution. PASTOR, B. & Co., of Ardennes, Namur (395, p. 1163),

have exhibited :-

 A gas-retort, weighing 14741bs.
 The hearth of a blast furnace for coke fuel, made of refractory bricks, and weighing 504 lbs. 3. A series of refractory bricks, for haing different

parts of blast furnaces, also burning coke fuel, 4. Drainage pipes of various dimension

5, Specimens of clay of different qualities, especially refractory clay,

The same distinction is awarded to F. Costr., † of Tilleur, Liege (397, p. 1163), who has exhibited two sets of crueables, the one made of a mixture of plumbago with elay, and the other of refractory clay only. The former are intended for fusing steel, and are divided into three parts, the lowest of which only is the cracible, properly so ealted, the intermediste portion serving to contain an additional charge, so that when the fusion is complete, the true crucible is entirely filled. The Jury notice this arrangement as presenting some interest.

The Exhibitors having the numbers 12, 14, 15, 396, and 353, have obtained Hosoarable Meution TOMBELLE-LONDA, E., of Bonneville (12, p. 1151).

Specimens of porcelain elay. DE-GAIFFIER D'IlESTROY, the Baron of Mullien, near Namur (14, p. 1151). Specimens of porcels in clay. De Ferrare, F., and L., of Wierde, near Namur (15,

p. 1151). Specimens of plastic clay, employed in the ma-nufacture of fine pottery. * This Company was awarded a Prize Medal by the Jary

of Class v., in whose list its owne spicers. I. W.

† This Exhibitor has been awarded an Honourable Mention by the Jury of Class XXVII., in whose list his same appears .- l. W.

TENSONNET and Danter, of Namicle, Namer (394, p. 1163. Samples of fire-clay. Connectat Commission of Marchin (396, p. 1163).

A quarterse convlousinte with a s.l.ciors cement, forming the Lase of the ceal measures, and violding a material absolutely refusetory for the construction of the hearth or cracible of blast furnaces. Blocks of this couplemerate cul and arranged for the construction of a crucible

Botchin, T., of Pandour (399, p. 1163). of refractory clay; gas retort manufactured of this clay. Saggers, for baking porcelain.

States, Grindstones, Hones, &c ..

Belgium, a country which consists in great part of palayoxoic deposits, possesses a great number of rocks adapted to the manufacture of grindstones and hones; and as the slate formation (one member of the group) is especially developed, the working of slates is also very active in this country. The geological constantica, which always has a great influence on the commerce of a country, here exercises a powerful action, and this depart-ment of industry is represented in the Crystal Palace by several exhibitors. Since, however, slates, whetsteads, and other products of this kind, require no clunge in preand other presents of this kind, require to example in pre-paring them for the market, the peculiar form in which they are wanted involving the only modification they mudergo, so that there are thus no very great difficulties in the way of their preparation, the Jary twee only thought it necessary to distinguish them by Heasurable Mentions, except in the case of M. E. Di. St. HUBLET 8, p. 1151; to whom a Prize Medal was swarded. count of them would be almost exclusively technical; so that, notwithstanding the interest which attaches to this branch of industry, it is impossible in this Report to do more than enumerate the products. COLETTE-DOUGHT, F. L., of Bertrix, Laxemburg (3),

has exhibited -1. Writing stones 'slate pencils?

2. Hoses from differentrocks, and for various purposes 3. Specimens of slate of various qualities and sizes. JEAN ANTOINE GUILLAUME, of Bovigny (1, p. 1150), Charles Joseph Otte, of Vielsalm (2, p. 1150), Christophe Lamberty, of ditto (3, p. 1150), PILEME JOSEPH OFFERDELS, of ditto (4, p. 1150), AMBERTY BROTHERS, of Stavelot : 25, p. 1152), DUPLERRY, jun., of Vielsalm (494, p. 1166),

have all exhibited very good collections of whet tones, as remarkable for their dimensions as for the care taken in

their preparation.

J. B. Falton-Pinon, of Numur (10, p. 1151), has exhibited a fine block of black markly, peculiar to the district, which can be produced in large masses, sad at a low

ED, DE ST. HEBERT, of Bouvignes (8, p. 1151), and J B. MORIMONT (9, p. 1151), have exhibited millstones of good quality, the cellection of the fermer being on a him for the award of the Prize Medal. This source of industry was only introduced into Felglum since 1846, but has already become insportant. The mills tones from the province of Namur possess qualities which reader them comparable with those from La Ferte-sons-Jouarre, in France.

CHINA.

China, so righly represented in the Crystal Palace by its silk stuffs and porcelain, has only obtained a solitary its sifk stuffs and porcelain, has only ortunate a solitary theomership Mesticas for its mineral productions. This is granted to R. Auccex, Ego, H. B. M'ss Counul at Shaughni (1, p. 1418), for a cellectin of materials em-ployed in porcelain menufacture at the great porcelain works of Kning Thit Chin, near the Poyang I also.

This collection includes specimens of prepared clays, and also a series of pigurant employed in percenti-work. In their present state it is impossible to determine the acture of the materials without analysis; but they are exactly analogous to a more complete collection. forwarded to the Ecole des Mines in 1846 by Mr. Stanislas Julien, nember of the French testistic, who had received the specimens from Mr. Jueph Li. To the prepared elays, Mr. Li had radied some compact febapatite rocks resumbling the Conside clauss. These rocks are reduced to a paste under n mill, and serve partly for covering the porcelin with a plane, but are also mixed in various proportions with the paste intended for the percelain, making the procedure of the pro

CHILI.

We have already, at the commencement of this Report, referred to a unguificent specimen of native silver, weighing 154 lbs., nhtained from Chili (p. 1429).

The mines of request without refutility to important mapping of timent results in Civilia and was of silver, was requested results as clean in Civilia as those of silver, year, and this regulate in one placed among the smaller special control of the civilian and the regulate in Civilia and of two kindes—trivinos proportion of the opport small as manufacture. The zero of this metal worked in Civilia and of two kindes—trivinos proportion of the copy and into, which was it is, different control of the civilian and the control of the civilian control of th

sequence of there being an admixture of metals, supposition of there being an admixture of metals. This fine specimen is from the mine of Madre Lios, near Coquimbo, and was obtained at the depth of 49 yards below the surface, and weighs 300 lbs. An Ordinary Mentium is awarded to the exhibitors.

ECTPT.

The Egyptian Government has exhibited (1 to 18, p. 1412) some infinency, which would be n' interest if they were accompanied by indications of their origin, hut, with the exception of the antron obtained from likes in Lower Egypt, we are ignorant of the localities whence the various apecianes coine. They belong in elays for the most part orchrosis, list one, notwithstanding this common construction of the control of the co

The Jury, while regretting not to have been able to procure details concerning the position of these minerals, have still testified the interest which they feel in the discovery of sulphur in the Egyptian territory, as well as in the extraction of natron, and they make Honourable Mentium of these two objects.

FRANCE (p. 1168),

The mineral industry of France is at present almost eatirely concentrated in the working of coal and the production of iron, which is the working of coal and the production of iron, which is the production of iron, which is the production of iron, which is the background of the production of iron, which is not less rich in inetalliferous deposits than neveral other countries in Europe eclobarted for the prosperity of their mines. Official documents, recently published by the Freuch Government, show that the number of

known and worked mining localities amounts to 500, which, in relation to the erystalline rocks, may be grouped into five metalliferous districts corresponding to the five mountain ranges of Brittsey, the Centre of France, the Vosges, the Pyrenees, and the Alps. These communicates to France a perculsiar geological character, and in some degree qualitie the climate, the higher monstains being situated in the southern part of the

country.

It is clear from written decounterly need yet more from the list clear from written decounterly need yet more from the last clear from the last clear from the last clear from the clear from t

for the production of autimony, and 3,2001, for the reopened copper mines of Nt. Bel and Chessy.

The working of ceal and the production of iron form a happy contrast to the workings of metal mines, and we proceed to make known in a general way these products.

Working of Coal.

About the commencement of the eighteenth century this branch of mineral industry, now so flourishing, hardly existed at all; the coal known at that time at St. Etienne, Alais, Vigan, and St. Gervais, in the department of Hernult, being used only by the blacksmith; and it was not till this time that any serious researches were made for coal deposits. In 1734 was first discovered the existence of mineral fuel at Anzin, now the centre of one of the finest coul districts in Europe; while in the same year commenced the workings at Crensol, a spot which has become the cootre of the important coal district of the Soone and Loire. From the date of these discoveries the use of coal became more widely extended, and it was soon applied to the manufacture of glass and the hurning of lime; but it is only since 1802, a period when industry made rapid progress, that the extraction of coal acquired an important development. In 1789 the total production in all France barely reached 215,000 tons; but in 1802 it had already increased in 900,000. Stationary then till 1829, it rose in 1830 to 1,600,000 tons. In 1845° the ufficial returns show that it reached to 4,202,091 tons, and now France occupies the second place in reference to the production of this mineral, im-mediately succeeding England, whose production is, however, eight times as great.

The vast development of the extraction of coal in France attest the corresponding development of all those industrial occupations of which coal is one of the elements of production. It affords a startling proof the progress made in all the useful arts during a period of a third of a coutary passed in perfect peace.

Production of Iron.

The mounfecture of troe has always been tolerably active in France. The error of this metal exist there in almost all the geological formations, but are especially excluded the property of t

Comptes rendus des Travaux des logenienes des Mines, toure xiv., 1846, p. 21.

this position of the irru ores in the midst of forests has following tabular statement establishes this interesting always been taken advantage of for the construction of fact:-foundries. Each of the tertiary plateaux has thus long been a small metalliferous district where the manufacture of iron was active in proportion as the wood was abun-

dant: and these districts have for many ages been the

y sources of the supply of iron. Within the last 25 years, since the manufacture of iron has been carried on with coal fael, the position of those establishments where wood was employed has been essentially modified; and, in fact, the introduction of iron made with coal, the cost of which is so much lower than when made with wood, and which is only limited in quantity by the extent of the demand, has changed the conditions which nature seemed to have established Charcoal iron could not have borne up at all against the furmidable competition of that made with coal, had there not been an important modification of the methods of treatment, consisting of the introduction of coal in the ultimate processes adopted to produce wrought iron from the pig, the use of charcoal fuel being retained in the first production of the pig itself. These further pro-cesses with coal fuel are carried on in works specially constructed for the purpose on a large scale, situated where the coal can be obtained at a moderate price. This mixed method has produced a great reduction in the price of iron, which has fallen from 70 to 27 france for charcoal iron, and from 52 to 22 for that made with coal; and the difference in price has been obtained without the superior quality of the charcoal iron being at all offeeted

This method, while lowering the price, has also given a great development to the manufacture of pig and wrought iron. If, for example, we take the production of pig as the term of comparison, we find that between 1819, when it amounted only to 112,000 tons, and 1845, when it reached \$22,385, the increase was in the pro-portion of 100 to 465. Even this is only the fourth part of what is produced by Great Britain; but on the part of what is produced by Ocean in the first rank of iron-Coalineat, France is now placed in the first rank of ironmaking countries. It appears, from statements unde in the annual report of the Corps des Mises, that the three countries on the Continent which come next in order to France in the manufacture of iron, are Russin, Sweden, and Pressia, and that the make of the first from 1835 to 1838 was 189,000 tons of pig; of the second, in 1839, The average in France of the three years 1835 to 1838 was 239,000; in 1839, 305,000; and in 1840, 348,000.

The mixture of fuel adopted has allowed of the use of part of the vegetable foel, formerly employed in the manufacture of wrought iron, for the making of pig; but, at any rate, the statistics of the iron trade in France distinetly show that the use of cosl in preparing wrought iron is very far from having diminished the consumption of charcoal. Thus we find the quantity of pig iron made with coke and charecal respectively thus stated:-

	made with Coke.	made asth Charcoal.			
Years.	Tons.	Tons.	Total To		
1819	2,009	110,500	112,50		
1830	27,103	233,258	266,30		
1840	77.063	270.710	347.77		
1846	233,703	282,683	5.44.91		

Whence it appears that while, in 1819, the amount of pig iron made with coke was only one fifty-sixth part of the whole production, it amounted in 1830 to a thirteenth part, and in 1846 reached to 46 per cent., or searly half

of the whole amount.

A similar fact may be observed with reference to the refining of pig; but the proportion of wrought iron manufactured with coal, being much larger than in the former case, the equality of production from the two sources was established between 1835 and 1838; after which latter date, the consumption of charcoal in this branch of the manufacture has been nearly stationary, the proof coal has, however, continued to increase, and in 1846 70 per cent, of the wronght iron was thus made.

Quantity of Iron made with Coal		Quantity of Iron re with Charconi.	ade
Years.	Tons.	Tons.	Total Tow
1819	1,000	73.200	74.200
1835	101,380	108,159	201.531
1835	115,110	109.085	224,195
1846	254,325	105,865	360,190
The p	roduction of pig	iron requires at	least 130 p

ent, of charcoal, " for making, rething, and rolling; and the different processes of manufacture of charcoal iron consume at least 145 per cent. Combining these figures with those which precede, we find that the total consumption of charcoal, in the production of east and wrought iron in 1819, was only 250,137 tons, whilst in 1846, it might have risen to 519,991; the latter amount being, however, in all probability, too great, since even in the charcoal foundries they frequently use coal in the re-heating process; but if we grant that this substitution diminishes the consumption of wood by one-half, it still results that the total consumption, in 1846, reached 443,239 tons, being almost double that of 1819. The use of coal in the manufactore of iron has not therefore, as is commonly enough supposed, done away with the use of charcoal. The two methods of operating have increased together, and on the same scale; and, on the whole, the production both of cast and wronglit iron has been quadrupted.

After this general summary concerning the manufacture of east and wrought iron in France, it is right to observe that the weak point with regard to the metallurgiral industry of that country consists in the dearness of fuel. It possesses inexhaustible stores of ore distributed in numerous localities, easy of extraction, rich, and in almost all cases of excellent quality. But so long as

* In many parts of France, only equal quantities of pig and charcoal are used, but the quantity stated in the text is a general average. We find, in fact, from the "Comptea rendus des Travaux des Ingénieurs des Mines," for the year 1846, p. 57, that the production of charcoal pig, and the consumption of fuel, were as follows;

Which shows a consumption of 130 parts charcoal for 100 of metal. With regard to the further processes of manu-facture by charcoal, we find, p. 59, that the refining at-Met, Quintate Met. Quincal

Nivernais " 874 454 1 273 289

Whence it follows that these methods combined show a consumption of 145 parts of chargoal for each 100 parts of wrought iron Applying these figures to the production of pig and wrought iron in 1819 and 1846, we find—

110,500 of pig iron, requiring 143,650 of charcoal 1816 242,683 366,487 73,200 of wrought iron " 1819 106,140 105,865 1846 153,504 The consumption of charcoal being therefore-Tons. Total Tons.

rolled and hammered hrass.*

Mr. J. M. F. Mehr, tolding engineer, of Auxin (627, p. 1208). Apparatus for the extraction of coal, and for

the descent and ascent of mines. It is now some years since a contrivance was introduced into the mining districts of Germany, England, and Belgium, the object of which was to prevent the great fittigue and frequent accidents experienced by miners on account of their having to descend and ascend the shafts of deep mines by means of vertical laiders or by the tubs and tackle used in lifting the produce. This apparatus consists of two wooden beams placed in the same shaft opposite to and balancing each other, and moving up and down by an alternate vertical motion communicated by machinery. On each of these beams small sets of horizontal planks or steps are placed, the distance between each being twice the length of one lift. The miner then standing at the bottom on the ascending being in order to come to the pit-mouth, steps to the apposite plank as soon as by the motion of the frame he is brought to its level, taking advantage of the short interval that elapses while the levels of the two steps are the same. He is then lifted again by the rise of this part of the frame, that on which he first stood descending, and again steps off when the lift is concluded. He thus rises step he step till be reaches the top, the best of these machines has been erected by M. Abel Waroone in a shaft of a coal mine at Marimont, between Mous and Charlerny

This apparatus was a great improvement in working

mines; but it is exposed to a serious inconvenience, as it

is impossible to life ore or coal from the shaft in which it is fixed.

Mr. Nikin has constructed a similar marbler, which were at the anni time in this theor or each, and converse at the anni time in this theor or each, and conbert in operation for three years in the "law"; pit an electric properties for three years in the "law"; pit an interference of the western of a pair of consected on, provided with new pit control or useful for wear of the pit and the pit control or useful for wear of pit and the pit control or useful wages, and the other of rade serves to risis the leaded wages, and the other pit to leave the expect on in the like the wages pit to leave the expect of the pit of the pit of the pit of short intervals of rest, during which they remain restings on other seasoes, exict in the inlies of the adult, and

length of one atroke of the vertical rods.

For lowering or raising the nuizers, the men step on moveable planks, in the place of the waggoos, and the descent or ascent is canducted in the same manner. The depth of the Davy pit, where this machine by M. Mébu is in operation, is 200 feet, the beans traversing 50 feet.

The Jury, considering that Mr. Mcha's apparatus is likely to be of important service in the working of mines,

have awarded to him a Prize Medal.

Mesers, Galliculus and Conyany, proprietors of the foundries of Bigny, department of the Cher (229), 1187, The exhibition from these foundries consists of various kinds of merchantable iron. Both iron and wire have been found to be of excellent quality, and a Prize Medal has been awarded to the exhibitors for the excellence of

their products.

Dixtracts and Sox," of Niederbeam (188, p. 1183). The objects sort by these exhibitms consist periody of monified cust-tree, not coming within the cognitance of their produces, the Jury do not feel justified; as wording more than an Honourable Mention in Mesors. District, They drain to direct attraction to several objects remarking, in the first place, as iron figure of Con Section 1889, the second control of the s

In the second place, the motion reduction of clicks for lithography, which introduce a new application of iron-casting to the art of engraving an stone with machinery. Very fine impressions are thus obtained; and in this particular matter the justly-eel-braide Berlin iron ware is equalled by Mesers. Dietrich.

By means of the engraving-machine there may be

* These Exhibitors have been awarded a Prize Medal by the Jury of Class XXII., in whose list their names appear, -1, W. obtained, with these clickés, delicate vignettes, which would seem difficult to inside, and some of which have already been used fur hank choques and letters of exchange. They have socceeded at Neidechroan in giving great

softness, tenacity, and flexibility to their cast-ten, and Messrs. Detrick have exhibited a sheet of this material, nucsuring 7 feet by 2½ inches thick, which is very flexible. The exhibitors consider that, for some purposes at least, these plates of cast-iron might be substituted for sheet-iron.

GANOILLOT and COMPANY, Rue Bellefond, No. 49, Paris (230, p. 118.) Hollow iron and tubes. The objects exhibited by Messrs. Gandillot consist of

The objects estimate by Mediri. Caladitot eessal to we distinct set; the one of tubes called light foles, intended for such purposes of construction, furniture, écc., and he or require that the joints should be close; and the and not require that the joints is should be close; and the being carefully supercy, are expalled of resitting a present of at least purpose, are expalsed of resitting a present of at least purpose, for conveying gas, or for warms for chemical warks.

These tules are manufactured in two different ways, seconding to the purpose for which they are intereded, and the pressure they are to bear. The cammon kinds which have to resist a prossure of only fifteen to wenty-five atmospheres, are united at a white heat, being welded by juxtuposition in a series of three to five decreasing draw-plates. The degree of resistance of the weld in these tubes depends on their greater or less thickness.

For purposes requiring a nauch higher pressure, M. Gamillet makes double tubes, and there the designates "without joint." To make these, he provides two comman tubes, such that one will just catter the other with effection. The number is then inserted into the larger, of the summer out at we will be summer of the summer of

mandage, a saggle state, unter in term without point, made, it lears it in some part of the circumformer, but not in the direction of the welding of the external tube; and if the trial is repeated in different portions of the same tube, which has been previously sawn into several parts for the purpose, at each trial the tear will commence in a different part, so that the answare of resistance of the contract of the contract of the contract of the or count histories.

MM. Gandillos. have added to their collection of obpetes exhibited, fragments of these has have been tested, and these show that in fact the testing does the place in various directions. For some purposes, especially fact the reasting of animal black, where the vapour requires to be very intensity heated, these those, described as "without joint," have perfectly neceeded. MM. Gandillott have, therefore, rendered service to industry by diddle have, therefore, rendered service to industry by the properties of the properties of the properties of the price Media.

Messrs, Gnother and Company, Paris (531, p. 1201). These exhibitors manufacture brase tubing of all sizes, from 1-24th of an inch to 6 inches (6**000) to 0**150) it diameter, the thickness being so graduated that all the sizes can be placed one within the acet above it. They also exhibit tubes for cutton printing, for telegraphic uses, and for focomotives.

The Jury have remarked with interest, amongst the products exhibited by Mears, Grantl, best tubes obtained by these ingections manufacturers, by a combination of the ordinary work of tube-drawing, with a regular rotation given to the principal tool used in the operation. These tubes tear less readily than jointed tubes, and are beginning to be used for conveying gas, under the same of the control of the control of the control of the conception and C. A. Prize Medal is avaried to Mears.

M. DEYECK, of Liancourt (Oise) (476, p. 1200). Crucibles for fusing metals The crucibles manufactured by M. Deyenx are of two distinct kinds, according to the

uses for which they are destined; those intended for fusing broaze, copper, gold, and silver, are marked with the letters [A.D.]; the utness, manufactured expressly for the fusion of cast-iron or steel, are marked No. 28.

These crucibles have been in use for the last tey gern, and certificates forwarded with the objects exhibited, and signed by the Baron Theward, and Musers, Barred, and Muser, Barred, and Muser, Barred, Muser, and the second state of their judgment in the matter, the opinion of men so termed and so competent to decide, and have accordingly to the second state of their judgment of the second state of their judgment of their judgment

rest has been exposed to a similar and sufficient heat.

When the distillation is completed, the box full of ealeined schist is removed and replaced by another; the
inventor considering that this arrangement causes a great
saving of full, since there is no need to cool the furnace
after each operation, as is the case with the ordinary
method.

ALGIERS (p. 1259).

The investigations corried on in Algiers within the last twelve years by the mining engineers charged with this duty, and by several industrial companies, have proved the e_sistence of a large number of metalliferous localities. The operations conducted at these places are not yet sufficiently complete to ensure profitable returns, although many observations reader this result probable.

and the district of the distri

the province of Algaes, and are working of mines of copper and lead.

The mines of Mourana include three groups of veins, composed of aniphate of barytes, carbonate of iron, and grey copper ore. They are situated on the southern side of the first mountains of the Atlas range to the north of

Medenh, and have been worked since 1844, employing

The veius of Cape Tenés are altogether different, the veintone being a ferriferous delionitie, mixed with best of clay and ore, consisting of copper pyrites. These veins have been worked for two years, and are resumitable for their great number and for the space over which they spread, a circumstance which readers the preparatory operations very costly. They, as well as those of Monziai, occur in sundatones and cretizeous clays, which

appear to correspond to the mocinyo of Italy.

The mines of La Calle are worked in a fine vein of
argentiferous galena mixed with ferruginous clay, the
veinstone being quarray. They have been worked with
activity for about two years, and have already yielded
results of rome importnoce.

zine works.

In order to follow more conveniently the emmeration

of those objects that have here noticed by the Jury, we will group lopether those of the same nature, although they are not all rewarded in the same maner. We are undelsted for most of the observations that will appear in this part of the Report to notes with which we have been farmished by Mr. Schreiber, member of our Jury from the Zollverein, and we shall begin by recapitulating the two exhibitors who have obtained the Commit Media

The first of these Council Medala was granted to Mr. W. GUNTILEN (6, p. 1048), of Reichenstein, in Silesia, and Profesor PLATTYER, of Freiburg, for the process of separating gold from arcenical pyrites. This process, amply illustrated by the series numbered 6 in the Catalogue, has admitted of the profitable re-opening of the nurferous nuises of Reichenstein.

The second is to Mr. Kneep, of Essen, for fine specimens of steel (649 and 677, pp. 1086, 1087), manufactured by a process peculiar to him.

Iron Ores and Bat Iron,

The Jury have awarded two Prize Medals and three Hommrable Mentions for this part of the Exhibition, The following have Prize Medals:—

ROYAL IRON FOUNDRY AT MALAPANE, BERT Opeln (2, p. 1047; Messes, Girnanth Brothers, forge-masters of Hoche-

leim, in Rheuish Bavaria '95, p. 1102 . The Royal Iron Foundry at Malapane employ charcual fuel, and exhibit iron nres, east and wrought iron, and the slags and einder collected during various parts

of the process. There are also a pair of cylinders of east steel of great hardness; samples of sheet iron of different thicknesses and length; specimens of red and white calamine from the mines of Scharley; various products obtained in the preparation of zine in the works in Benthen in I'pper Silesia, especially zine in ingots and sheets, and oxide of sine; and a very interesting product

obtained at this establishment, viz., metallic cadmium, These foundries have also a high character in Prussia for the quality of the cost and wrought irou and steel which they manufacture, and the articles exhibited in London fidly justify this reputation.

The exhibition sent by Mesers. Glenanth Brothers, consists of merchantable iron, gun-barrel iron, various kinds of sheet iron, iron ware of different numbers, and steel of various qualities. The products of Mesers. steel of various qualities. The products of Messrs. Gionanth are much valued in Germany, the steels being

especially in demand (p. 1102). Honourable Mention has been awarded to-

laminated pig, refined iron, and bar iron,

ROYAL FORCES AT LORE AND STARLBERN, BEAR Siegen (324 and 326, p. 1069). Spathie irou, lamellar white pig, natural steel, and

forged steel.

J. Haviniock, of Crombach, near Siegen (454, p. 1076). Ores of iron from the mines of Museu, with specunens of forged and refined steel. J. H. Darseen, sen., of Siegen (449, p. 1075). Ores of iron from Hohegrethe, Peterback, St. Andre, and Hath Mines, situated in the neighbourhood of Hamm, White

Natural Steel, Blistered Steel, and Cast Steel.

The manufacture of steel is very actively carried on in the states of the Zollverein, as it is calculated that out of 21,000 tons (210,000 met, quintals) furnished by the whole of Germany, their proportion amounts to 8,000 tons, that of Austria being 13,000. The abundance of the ores of spathic iron, resembling those of Styria and Carinthin, has had the same effect as in those two states of Austria, in inducing a great development in the manufacture of natural steel, while the converted or blistered steel is the exceptional form, the latter being ninre difficult to work than the natural steel, and both being ohtained in Germany at about the same price. The cast-steel works are of some importance; and we have noticed the important results obtained in this manufacture by Mr. Krupp, of Essen.

Among the establishments who have exhibited materials of this kind the Jury notice four, and to two of these Prize Medals have been awarded :-LEHBRIND, FALKENBOTH, and Co., of Haspe,

Hagen (447, p. 1075), who have exhibited ingots of cast steel, and forged steel of various kinds. HITH and Co., of Hagen (632, p. 1085), who have also exhibited steel in its various forms of blistered, forged,

and cast And Honnurable Mention has been awarded to-Mr. Vorsten, of Eilpe, near Hagen (446, p. 1075)

Messrs, Boeing, Roenn, and Lersky, of Limburg (453, p. 1076). The steels exhibited by Messrs, Lebrkind and Co., of Haste, have been obtained by a peculiar method in the

paddling furnace. According to Mr. Schreiber, their rice is lower than that of other German steels, being sold at 22/, per ton. It would seem that similar attempts have been made in other works, but without success. Mr. Vorster, of Eilpe, bas obtained malleable iron and steel directly from the pig.

The difference made between these four exhibitors is the result of an examination of the objects exhibited, and not a comparison of the relative importance of the establishments, and the quality of their products.

Ores of Lend and Metallic Lend.

ESCHWEILER MINING COMPANY, in Stolberg (318, Batterio S A Prize Medal has been awarded to this Company for

the detailed exhibition it has made of the products of its mines and foundries. These consist of ores of lead and since and foundries. These consist of ores of less and sinc from the mines of Deppen Kirchen and Breiniger Berg, near Aix-la-Chapelle, of Bleiberg, between Cologne and Siegen, and of Kickfeld and Heidehen, near Aix-la-They also include pigs of lead and give, and Chapelle. a cake of silver obtained at the foundries of Birkenyang and Binsfeldhammer, near Stolberg.

Honourshle Mention is awarded to the following :-E. F. OHLE (Heirs of , of Breslau : 62, p. 1052), who exhibit lead nipe of various calibre, sheet lead, and lead

MEINERERAGES and KREUSER BROTHERS, of Mechenech and Commern (316, p. 1068), who exhibit lead ores from the mines of the Count Julius, of Lippe, and Mesers. Kreuzer, Brothers, hesides pig and sheet lead.

Zinc and Cadminu. The production of zinc is well represented in the Ex-

hibition, and the Jury have awarded to this branch of industry three Prize Medals and two Ordinary Mentions, ROYAL IRON FOUNDRY AT KONGUSHETTE (3, p. 1048). A Prize Medal for ores of sinc, metallic zinc, and metallic

RUFFER and Co., of Breslau (11, p. 1048). ment of sheet zinc, two samples being as thin as paner. and remarkable for their style of execution. Sheet zine for roofing. Also a Prize Medal,

C. ROCHATZ and Co., Müllieim on Ruhr (452, p. 1076). A Prize Medal for specimens of zine ores from different mines, and for manofactured sine of fine quality.

Ordinary Mention to Messrs. Bakpr and Co., of Stolberg (315, p. 1068), for zine and lead ores, including some rare ores, such as Wilhemite, chloro-phosphate of lead, and erystalline carbonate of lead; and also to Mr. HAGEN, of Cologue (322, p. 1069), for calambie from the mines of St. Murgaret and St Joseph, near Mülheim, on the banks of the Khine.

Copper.

The working of copper is exclusively represented by the combined MINING WORK OF MARKELD (859, p. 1096). Resides treating the empriferous schists for copper, they also separate the silver that is mixed with the metal, and this separation, formerly effected by liquidation, is now performed by a new process, enseering which an information has been given to the Jury. The Jury have information has been given to the Jary. The Jury have recognized the value of the result, and have awarded a Prize Medal to the establishment at Mansfeld.

Cobalt.

P. Grarr, of Siegen (592, p. 1083). The exhibition of cobalt is only made by this exhibitor. The ore which he works is from Hoffnung, near Siegen, and consists of minute microscopic crystals disseminated in an argilla-ceous and quartzy schist. The ore does not yield more than 23 to 3 per cent of metal; and the method adopted in warking, as described to the Jury by M. Schreiber, is extremely perfect, not more than twn parts in a million of cobalt being lost. Honourable Mention is awarded to Mr. Grayr.

Mangamse.

The ores of manganese are ebiefly employed in the manufacture of chlorine and the chlorides, and do not therefore undergo any metallurgical preparation; so that the care with which the working is conducted and the picking of the ore are the nuly matters that the Jury can reward. They have been able, therefore, to grant anthing more than Ordinary Mentions for this branch of industry, and these have been awarded to two Pressian and two Nassan exhibitors as follows:—

Mr. J. BIEUEL, of Blessen, near St. Weudel (311, . 1068). Manganese in crystalline masses and in powder, prepared for the manufacture of chlorine.

Mr. J. H. Heatnex, of Ilmenau. Manganese, crystallized, in five speciment, and massive.

ROSENBERG and Co., of Giessen (Hesse) (2, Oxide of manganese, in very fine crystals; a p. 1125). very pure ore

Messrs. W. Bargt and Co., Giessen (4, p. 1125). Similar ores in crystals, less perfect.

Coal, Cohe, Lignite, and Bitumen. The details given at the commencement of this part of

the Report have established the importance of the coal basins and beds of liquite, and we have only here to add that the deposits of the latter fuel belong exclusively to the tertiary period.

Among the small number of persons who have exhibited roducts of this kind, the Jary have made Ordinary products of this willing three:

Mr. H. A. STINNES, of Mühlheim on the Ruhr (448, p. 1075). Coal and coke of great purity, from the taine of St. Victoire Mathias,

of St., victoric vitalias.

Mr. F. Haniel, of Ruhrort on the Ruhr (455, p. 1076). Coal of different qualities from the mines of Heinrich, Steingalt, Hageaback, Sälzer, and Neuack. Coke manufactured from the coals of the three last

Messrs. A. Wiesman and Co., of Augustenhutte, near Bonn (334, p. 1070). Bitumen, mineral oil, dussodyle, and various products obtained from the distillation of bitumen.

Amber.

Amber is found associated with certain lignites, and is tolerably abundant, but transparent specimens of fine colour are rare, Prussin being almost the only country by which they are furnished for commercial purposes. They are collected chiefly in the environs of Konigsberg and Memel, on the shores of the Baltie, and according to the rules established by the Jury, they ought not, perhaps, to graut rewards for this material. Considering, however, that a certain degree of intelligence is required ia collecting it, and selecting the pieces proper for cutting, Honourable Mention has been granted to Nos. 40, 438, and 441.

D. F. TESSLER, of Stolp (40, p. 1050). Two very fine specimens of rough amber; and a third specimen contain-

ing insects.

W. Mannheimer, of Kouigsberg (438, p. 1075). Two specimens of amber, weighing respectively 6 lbs. and W. Von Rov, of Duatrig (441, p. 1075). A fine collection of ambers, differing in colour, brilliancy, and transparency. The exhibitor has been 25 years making his collection, and the rough specimens are accompanied by manufactured articles, several of which are of great value.

Working of Salt Mines and Parification of Salt. lo most of the states dependent on the Zollverein, salt is obtained from the evaporation of saline springs. The trade is not open, the salt-works being conducted by the The Jury have granted the following Government, Ordinary Mentions:-

ROYAL PRESSIAN SALT-WORKS OF DUNZHERG (445, p. 1075). The collection sent by this establishment consist of impure and prepared salt, of various degrees of finepess.

SALT-WORKS OF SALSHAUSEN, in the Grand Duchy of Hesse (3, p. 1125). Common salt, purified salt, ligaite and hituminous wood employed in the evaporation of the brine; various products of the salt-works.

SALT-WORKS OF THEODORSHALLE AND KREUZNACH (Hesse 5, pp. 1125, 1126). Salt in grains; erystallized salt, remarkable for the size of the crystals. Concentrated mother-liquor, containing iodine, bromine, and chloride of calcium

Millstones, Marbles, and Refractory Clays. S. Landar, of Andersach (321, p. 1069). Lavas pos-sess the property of millstones up to a certain point,

This Exhibitor has been awarded an Henourable Mention by the Jury of Class XXIX., In whose List his name appears. - I. W. being vesicular and hard, and their application in this may be productive of very good results. The Jury, guided by this consideration, have granted

a Prize Medal to Mr. Landau, who has exhibited excellent lava milistones from Niedermendig, near Audernach. These stones, of which the dimensions vary from 18 inches to 6 fect in diameter, may be employed for grind-ing corn, preparing oil, and for all agricultural pur-

F. Zellen, of Neckar-Tourlingen, near Stuttgard, F. ZELLER, Of Necessry consumers, went crimagana, Wurtemberg (1, p. 1114). Specimens of stone from Mr. Zeller's quarries, arranged for the manufacture of millstones. According to their different conditions of hardness, grain, and colour, these millstones are employed for grinding wheat or other grain. Honourable Mention is unde of Mr. Zeller für this interesting manufacture

The Counsellor Von Minutoli, of Liegnitz (191, p. 1058). Amongst anmerous objects of autiquity and architectural decoration, this gentleman has exhibited some very fine marbles of Silesia, for which the Jury

have awarded an Ordinary Mention.

M. DE MULMANN, of Zeche Plato, near Siegburg (319, p. 1018). Refractory clay, refractory bricks for lining the interior of blast furnaces, and crucibles for steel casting. The crucibles are considered by Mr. Schreiher to be of good quality, and they are made of the same clay as the bricks, to which, however, is added graphite from

Messrs. Kapeller and Son," of Hafnerzall, near Passan (28, p. 1099). The reputation of the plumbago crueibles of Bavaria has been long established, and they were considered, till lately, as the only ones that could compete with those employed in the steel-works of Shef-field, and manufactured of Stourbridge clay. Those These crucibles owe their superiority to a mixture of plumbago, which modifies the dilatation and contraction of the material of the crucibles when they are exposed to the high temperatore of the steel furnaces, or withdrawn to pour out the steel.

The erucibles of Mesars. Kapeller are of very different size, and we have noticed some 2 feet high and about 20 iaches in diameter. According to their dimensions, and perhaps also the preparation of the clay, these erucibles are employed for fusing silver, gold, ur steel. A Prize Medal is granted to Messrs. KAPELLER for the

excellent manufacture of their crucibles. Geological Maps and Collections.

Geological maps and collectious are properly regarded as a means of spreading geological knowledge, and favouring the development of mineral industry. These considerations have induced the Jury to grant a Prize Medal and two Honourable Mentions for different geological maps, published by several editors in different German states, although these editors have in no degree participated in the investigations made in preparing these maps.

The Prize Medal has been awarded to Mesars. JONGBAU and VENATOR, booksellers of Darmstadt, for their beantiful relief maps:-1. Of the Grand Duchy of Hesse, and the Grand Duchy of Nassau, executed by M. Ewald, Secretary of the Geographical Society of Darmstadt. 2. Of Wartemberg, Baden, and the countries surrounding the Palatinate and Alsace. These maps are part of the exhibition of Hesse (6, p. 1126). Honourable Mention is made of T. DICKERT, of Bonn

(432, p. 1074), who has prepared relief geological maps of the Siebengebirge, the Valley of the Rhine, and Vesuvina; and also of Mesors. Scunory and Stron, of Berlin (303) who have published a coloured lithographic series of geological maps. MINERALOGICAL and METALLERGIC COLLECTION of the

Duchy of Nassat, collected and exhibited by the GOVERNMENT ENGINEERS of Mines (Nasanu, 1 to 5,

* These Exhibitors Lave been awarded a Prize Medal by the July of Class XXVII., in whose l-ist their unmest appear. - I. W.

The interest possessed by this collection, which includes the useful minerals and the different rocks of Nassau, and the productions of the most important mining establishments, has induced the Jury to award a Prize Medal to the Exhibitors.

CLASS L.1

We do not repeat the names of the minerals and rocks contained in this fine collection, and merely refer to the establishments which have assisted to form it. These are as follows:-

M. Lossey, Iron FOUNDRY of MICHELBACH (2, p 1132), to whom the Jury awarded an Hosourable Mention.

ISABELLENBUTTE SMELTING WORKS DEST DILLENBURG (3, p. 1132). In this establishment, partly devoted to the preparation of pickel, arsenic is also obtained, and various alloys are

manufactured, especially German silver, composed of 8 purts copper, 3 nickel, and 3\(\frac{1}{2}\) zine.

Marke Manufactory of Diez (5, p. 1132). nurhlea of Nassau, worked in this establishment, all belong to the palæozoic rocks. They include fine black varieties, and others which are red, yellow, and grey.

GREECE (p. 1400).

The GREEK GOVERNMENT has sent for exhibition a series of specimens of minerals and rocks, marked in the Catalogue with the numbers 15 to 50 (p. 1400). collection, grouped according to the provinces, chiefly includes a fine series of marbles and materials for construction, obtained for the most part from the cretneeous

limestones, either compact or erystalline,
We notice also pazznolanas from Santorin, emery from Naxos, meerschaums from the environs of Thebes, and lithographic atones from Messina. The latter are of even

grain, and appear to be of good quality. The Jury wish to make Honourable Mention of the ane sury wish to make Honourson Alenhoin of the GREEK GOVERNMENT (pp. 1405, 1446), on account of the interest presented by the series of marbles, as well as for the discovery of lithographic stom in that country, and also of Millo (15, p. 1402) for samples of stentile (the scapstone, or French challs of commercial).

NEW GRANADA (p. 1430). E. Paris, of Bogota (p. 1430), has exhibited very fine emersids from the Muzo mines, which supply almost all the precions stones of this kind imported into Europe. These ameralds, which are all erystallized, are attached to the parent rock, and thus possess a geological interest.

An Honographa Mention has been awarded to Mr. Panis,

PORTUGAL (p. 1306),

Among the objects sent to London by Portngal a large number of specimens of marbles may be noticed. There are two excellent series of these, the ona exhibited by Mr. J. de Figueiredo (120 to 231, pp. 1309, 1310), and the other hy Mr. Dejeant (232 to 257, p. 1310). All the he other hy Mr. Dejeant (232 to 257, p. 1310). All the pecimens are in squared or rounded slahs, and polished. specimens are in squared or rounded states, and pointers. The colours are very varied, white and dark grey predominating; but there are also fine yellow and deep and beantiful violet tints. Almost all the marbles are crystalline; hat one amongst them is a very fine round elab, with specimens of "Chama ammunia," in which the shell with specimens of "C. Saimi ammonia," in which the shell is preserved. These fossils, which are of a deep-grey colour, stand out from the marble, which is of a yellowish grey; and it is interesting to see them thus completely preserved in a limestona of which the erystalline eon dition is so decided. The Jury have desired, as a matter of geological interest, to learn whence these marbles have been obtained; but the localities are not indicated on the specimens, and the persoo in charge of the Portunese exhibition has not been able to give any assistance

guese extinition that this respect, Mr. Dejeant has also exhibited (110, 111, 115, p. 1309) lithographic stones of even grain and very compact Similar stones are sent by the Duke of Palmella, and

also by the Royal Tobacco Contractors. Honourable Mentions have been granted to the DUKE of PARMELLA, Mr. DEJERNY, Mr. DE FIOUERINGIO, and to the ROYAL TORACCO CONTRACTORS (p. 1309), for the

objects just described. Also to Mr. M. A. DA SILVA, (p. 1316), for the manofacture of lead for shot, of which he exhibits a fine series (991 and 1014), and to the Pao-PRIETORS OF THE MINES OF BRACAL (1295, p. 1318), for specimens of lead ore and manufactured lead.

ROME (p. 1235).

The Iloman States have sent to the Exhibition tolerably large number of manufactured articles, but only five ur six persons have exhibited the productions of the mineral kingdom. Of this small number the Jury have given Ordinary Mention to two, vis., the COUNT BIAN-CONCINI (1, p. 1285), who has forwarded perfectly puro quartz, sand, and other materials used in the manufac-ture of glass; and Messrs. Pasquall and Donesico Rinalds (2, p. 1285), who send a collection of native asphaltes, and the products of purification of this hituminous mineral.

RUSSIA (p. 1361).

The gold mines of Russia have yielded for some years past a revenue of nearly four millions sterling; but as their working consists of mere stamping and washing, the latter offering few difficulties on account of the high specific gravity of the metal, this important source of riches to the country has little interest for science. On the other hand, the working of iron affords great variety in the methods of proceeding, requires powerful nu-chinery, and its manufacture, joined to the working of copper, forms the principal part of the mineral industry of Russia. This fact has produced its effect in that part of the Exhibition from Russia coming under the cognizance of this Jury, which is, indeed, to a great extent, confined to the objects sent from the iron-works, and ehietly those of the Government, namely-

THE INPERIAL FORCES OF ALEXANDER, at St. Peters-

burgh.
THE IMPERIAL FOUNDAMES, for CANNON, at Olonetz. THE IMPERIAL FOROES OF KOUSHVINSE, OF GOROE-

LAGODATSK, and of KAMENSK, situated in the Government of Perm. THE IMPERIAL ESTABLISHMENTS OF NUNE-TOURISSE.

VERRHNE-BARANTCHINSE, RED VERRHNE-TOURINSE. THE MANUFACTORY OF ARMS, OF ZLATAGUST, TAT-KINSE, and TOXISE. These works are supplied by metalliferous deposits, which are remarkable at once for the abundance and the

excellent quality of the ores. In this respect we may mention, as of the first importance, the celebrated deposits of magnetic iron ores of Goroblagodatak, which yield the ores used by the works numbered 1, 7, 10, 11, and 12 (p. 1362, 1364, 1365), in the Catalogne,

Among the principal articles obtained by the fusion of these ores in the imperial establishments, we may mention, as having principally attracted the attention of the Jury, the castings for cannon, and the projectiles from the works at Glonetz, the fine hammered and rolled irons of Verkline, Nijne-Tourinsk, Verkline-Baranteliinsk, and different forges dependent on the group of Ziatnonst. Several remarkable productions prove that Russia now

repares, with success, for its own consumption, the metals which it formerly exported in the unmanufactured state to foreign countries. Among these we may mention drawn, shear, and rolled steel, from the works at Ziatzonst. A scientific supervision has been exercised in the foration of these collections, which represent the operations of the different establishments we have mentioned. Jury have remarked with interest the series of minerals and rocks accompanying the principal ores of the Ural and the Altai, and have wished to reward the care with which the collections have been prepared by granting a Prize Medal to each of the persons charged with their preparation. Since, however, all the establishments have been described as "Imperial," it has only been possible to award one Prize Medal to the RUSSIAN GOVERNMENT for the whole of this interesting exhibition,

Among the establishments not belonging to the Government which have sent samples of their productions to London, the Jury have remarked particularly the forges of Khamounitsky Viatka, belonging to Madame Ponomanerr (19, p. 1366). A Prize Medal has been granted to this high for the manufacture of the sheet iron granted to this indy for one manuscattle of the even-described as oxidised, a product remarkable for the evenness with which it is rolled, its tenseity, and the brilliancy of the surface.

A Prize Medal has also been granted to Messrs. DEMIDOFF, of Nijne-Tagilsk, in Siberia, (pp. 1377, 1378), for their collection of gold and platinum washings. To the nuriferous sands in the state in which they are found and in different stages of preparation, as well as scales of gold obtained by washing, these exhibitors have added specimens of the containing rock, and of the rocks found as boulders or pebbles in the auriferous alluvium. interesting series furnishes, therefore, a complete history

of the kind of deposit it illustrates.

Lastly, there are Honourable Mentions made of Messrs. A. and M. Pashkoff, of Orenburgh (23 and 24, p. 1367), who have respectively exhibited copper in ingots and also of the Imperial mines of Poland (15, p. 1366), for the fine specimens of the metallic endmium exhibited. This metal is obtained in large quantities from the common zine ore of the district, and is sent into the market at a price sufficiently low to induce, probably, a more extended economic application of it.

SARDINIA (p. 1302).

From this country the exhibition of mineral produce is hut small and unimportant; the awards of the Jury have consequently been limited to Honourable Mention to the following exhibitors:-F. GRANCE, of Handens, near Aiguebelle, Savov

1302), for spathic iron ores from the mines of St. Georges des Hurtières, S. Zolest, Chiavari (2, p. 1302), for specimens of slates,

rough for roofing purposes, and niso sawn and planed for internal fittings. D. Pianello, Chiavari (3, p. 1302), for a fine slab of slate, 5 feet 6 inches square.

Spatn (p. 1320).

We feel some difficulty in speaking of the objects in our class from this country, which is, however, one of our class from this country, which is, however, one of the most favoured by nature, in regard to the sources of mineral wealth. Thus Spain possesses wast deposits of coal in the Asturias, and in the province of Leon; its mines of salt at Cordova are as rich and as extensive as those of Wieliczka; ores of iron exist in abundance in all its provinces, and the lead mines of the Sierras, of Gader, and Almagrers, are richer than any that are known, shares ulso, with the mines of Idria, the monopoly of the trade in quicksilver throughout the world; and yet, not-withstanding all this, almost the whole of the mineral withstanding all this, almost the whole of the inneral collections sent to the Exhibition might be kept in a single drawer. The specimens which compose this series are also small, many of them badly selected, and almost nil of them hadly preserved.

The only rewards that the Jury have been able to give

have no reference to the important mines of which we have just given a very summary enumeration. They belong to the objects of secondary importance in the mining industry of Spain.

One Prize Medal has been nwarded to the LEGNESS.

ASTURIAN Company (21, p. 1330), which has exhibited steel of excellent quality. Four Honourable Mentions have been granted, viz .-

D. Juan Graó, of Malaga (23, p. 1330), for the manufac-ture of east and wrought iron, in his fine establishment, called "El Angel."

The Province of Connova (29, p. 1330); The Province of Sanagossa (32, p. 1339); and The Royal Lineary of Madrid (31, p. 1331), for the fine series of marbles exhibited by them

SWEDEN AND NORWAY (p. 1348).

The working of mines, and the production of metals, form a very active branch of industry in Sweden and Norway; the soil of these countries, derived for the most part from old rocks, and the severe climate of the north, being natural causes giving a great prependerance to mineral industry.

The working of copper, silver, and lead, is there very active, but the ores of copper are generally poor, seldom averaging more than about four per cent, when prepared for smelting, while some are worked which hardly yield so much as two per cent. These coppers are, however, much valued in commerce, on account of the ores containing neither arsenie nor antimony; and the annual supply amounts to 1,500 tons, of which the celebrated

[CLANS I.

mine at Fahlun yields more than half.

The mines of lead would be of uo value if it were not for the silver the ores contain.

The mines of Sula are the most important in respect to there metals, and it is estimated that they yield seven-eighths of all the silver produced in Sweden; for, although it is the enstom to regard the celebrated Kongsberg mine as of the first importance in the production of silver, its yield varies so greatly as to diminish considerably its value in an industrial sense. In fact, after being frequently abandoned, ou successive attempts, and after having shown a deficit of more than 80,000/, between 1815 and 1830, there were found parties sufficiently rich to undertake the working once more; and between the years 1830 to 1840 they have, after paying the deficit, shown a clear profit of upwards of 440,000/., with a staff of 110 miners

The cobalt mines of Skuterad, in the parish of Modum, in Norway, and those of Tunnberg in Sweden, have yielded considerable profits, but we are not aware of the

exact amount.

But, however important the mines of copper, silver, lend, and cobalt may be when taken together, they are but trifles compared with the products of the iron mines, which form, both in Sweden and Norway, a very prosperous branch of industry, especially by their intimate bearing on the cultivation of the forests. iron ores of Scandinavia consist of magnetic iron

ore, mingled accidentally with specular ore, and their average yield is as much as 46 per cent. The most celebrated are those of Dannemora, Uto, near Taberg, Nora, and Phillipstad; but the mines of Gellivara are also very rich, although the difficulty of communication is such that the produce from them does not exceed 1,500 tons; the total production of the country being 133,500 tons; the total production of the country being 133,500 tons. The reputation of Swedish iron is sufficiently established to make it unnecessary to do more than mention its ex-traordinary fitness for the manufacture of steel; but the quality in this respect being unquestionable, it might be quanty in this respect seeing anginesionans, a might so supposed that all deposits of magnetic oxide would be equally adapted to the manufacture of iron for the same purpose. This opinion has not been verified by facts, for numerous experiments, repeated both in England and France, have recently shown that the Swedish is preferable to all others, when it is desired to manufacture east steel of the finest quality. Even in Sweden there are essential differences between the different mices, which exist also in the different parts of the deposit at Danne-

highest excellence. Up to the present time, the causes of this superiority have escaped all investigation. The magnetic iron ore everywhere presents similar characters, except that the grain is more or less fine; but the chemical composition is frequently the same. There are, therefore, shades of difference of extreme delicacy which mark the facer kinds, but these may, probably, long remain a mys-tery to science. The best iron is produced at the forges tery to science. The best tron is produced at the forges supplied from that part of the deposit called the 'Middle Field,' or the 'Great Mine,' and the peculiarities of the ore are so persistent, that all the iron of the same mark usually presents with very great uniformity, and to the

mora, which mine alone yields the iron that is of the

same extent, the steel property.

This superiority of certain establishments over others. established by long experience, would have been sufficient to class the iron sent by Sweden for exhibition, if the Jury had had to award prizes only according to the quality of the iron; but they had also to examine the modifications of the methods adopted, and the care and ntention shown in preparing the different objects for ex-hibition. As far as Sweden is concerned, the difference of awards is almost entirely the result of the Exhibition,

for even the inferior kinds of Swedish iron are of a quality

very superior, when compared with the iron from other There have been awarded, for this brauch of industry, one Prize Medal, two Honourable Mentions, and three Ordinary Mentions: and we proceed to enumerate the establishments which have obtained them, in the order of

the award. FORUES OF MOTALA (6, p. 1349). Iron ores, east iron, puddled iron, bar iron, steel, and the slags and cinder of the different operations.—A Prize Medul.

C. A. Rettin, of Geffe and Kihlaforss (2, p. 1349). Ores from the Hummeriu mines, ju the district of Rodlagen. uenr Stockholm, east iron, wrought iron, and steel. Mr. Такжноw, of Laurvig und Pritnic, Nurway (36,

p. 1352). Bar irou; several pieces twisted cold into knots. To both of whom Honourable Mention is awarded; and Ordinary Mention to the following exhibitors:-T. LAGERBJELM, of Christinehamn and Buforss, Sweden (1, p 1348).

i, p. 1349).
Pursues of Hetterons, Sweden (4, p. 1349).
J. Floop, of Porsgrand, Sweden (7, p. 1349).
Silver and Load.—We have already stated, at the comrenement of this Report, that the celebrated mine of Konganeng had sent for exhibition specimens of ore remarkable for their large dimensions, and the benuty of the crystals of native silver ore. This establishment, which belongs to the Swedish Government, has completed the collection from this mine by specimens of silver in different states, and of the rocks which constitute the formation in which the veius occur. A Prize Medal has been awarded, for this interesting and instructive series,

the Kongsherg Silver Works (34, p. 1352),
The Mines of Guldsoedbrittan (16, p. 1350), sending argentiferous lead, have received Honorable Mention. OBES OF COURLY AND CHROME. - The TENABERG CO-DALT WORKS (9, p. 1350) furnish the richest and purest cobalt ores of Scandinovia, and Honourable Mention has been awarded for the objects exhibited from this establishment, including the products obtained in working, and the various operations which the ore is made to undergo, in order to obtain from it the oxide of cobalt.

C. H. Garmann, of Drontheim, in Norway (38, p. 1352).

—Chrome iron, raw and purified. This ore of chrone is much mixed with the veinstone. In order to purify it, the ore is pounded in a stamping machine, and separated mechanically in the usual way.

The Jury have awarded un Ordinary Mention to Mr. GARMANN for this application of the method practised in separating lead ores, to the preparation of the ores of chromate of iroa.

SWITZERLAND (p. 1264). For some years past, the manufacture of steel has had

a certain development in the Swiss Cantons; several esa certain development in the Swiss Cantons; several es-tablishments having been started successively at Bienne, Neurchâtel, and Schaffhausen. The products exhibited in London have been recognised as of very good quality; the steel for springs being especially remarkable for its elasticity, and the resistance it offers to fracture.

Two Prize Medals have been grauted for the products exhibited by Switzerland, unmbered 1 (p. 1265), and 41

exhibited by Switzeriann, unmovers 1 (p. 1000), min 1 (p. Neufchâtel (41, p. 1269).—Bar steel, rolled steel for making springs and steel cylinders, used in the manufac-

And Hononrahle Mention to J. C. Fischer, of Schaff-hausen (47, p. 1269).—Ingots of steel, called 'meteoric steel, hars of steel of different numbers, and various iustruments manufactured with this steel,

Mr. Fischer has added to his exhibition a drawing re-presenting the interior of his establishment, from which it appears, that the smelting furnaces are very small, and may be conveyed from one place to another without any * These Exhibitors have been awarded a Prize Medal by . siese exhibitors have been awarded a Prize Medal by the Jury of Class XXII., in whose List their names appear. —I. W.

other expense than that incurred by the removal of the bellows. Mr. Fischer states, that he munufactures cust steel by a peculiar method; but the drawing, the only document the Jury are enabled to refer to, does not indicate any difference between his method of melting and those already known, except in the small scale on which the operation is carried on.

Tescany (p. 1289).

The exhibition from Tusenny is very interesting in a mineralogical point of view, the Royal Technological Institution having scut a very fine collection of minerals. including a magnificent series of marbles and alphaster. and superb specimens of the numerous minerals found in the Isle of Elba. Amongst these we may mention once more a block of gneiss, covered with noble crystals of felspar, already noticed at the commencement of this Report; erystals of tourmaline, remarkable for the purity of their forms and the variety of their colours; anuamarines; and crystals of jeuite. The useful ores, also, have been included; and we find specimens of specu-

lur iron ore, galeun, and the ores of copper,
We have observed two blocks of mineral fuel (16-inch cubes) apparently of good quality. It is probable that this mineral belongs to the lignite deposits of Moute Massi and Moute Bamboli, which the Reporter has had the opportunity of visiting, and which agree with the lignites of Aix, the superposition of the bed which contains the lignite (itself about a yard thick) upon the Macigno being very certain, not withstanding that the quality and general condition of the fuel present all the appearances of true coal, and that it yields a coke. Although there is no positive mention of the locality attached to the specimens, we take it for granted that they proceed from this deposit; hat we wish, at the same, time to direct attention to the impressions of ferns and enlamites, placed near them, no doubt by mislake; for these latter are certainly of the carboniferous period, although no vestiges of the enal foruntion exist, either in Tuscany, or in any other part of the chain of the Apenuines

Of this fact the Reporter was aware from his own avestigations, and these have been completely confirmed by the interesting work just published by Professor Paolo Savi, in conjunction with Mr. E. Menechini,† The Jary, considering the high mineralogical interest of this collection, have awarded a Prize Medal to tho

ROYAL TECHNOLOGICAL INSTITUTE OF TUSCANY (p. 1290). A Prize Medal has also been granted to the ROYAL SALT MINES of Volterra (2, p. 1290), which has sent for exhibition specimens of salt obtained from the evaporation of brine, hesides specimens of alum and sulphur from the same establishment

Ordinary Mention has been granted to the exhibition of the ores of mercury of Levigliani Ripa, in the pro-vince of Pietra Santa; and of Yane, Castellazzaru, and Capita, in the pounce of Volterra; numbered respectively, 6, 7, 8, 9, 10, and 11 in the Catalogue (pp. 1290, 1291).

TURKEY (1385).

The mineral exhibition of Turkey is represented by a collection of upwards of 200 specimens, sent by the Otto man Government. It was but just unpacked when the Jury separated, and the specimens were lubelled only in the Turkish language, with which none of the members of the Jury were acquainted, so that it is impossible for them to state the precise value of the collection. It appeared, however, to be of sume importance by the variety of the metalliferous ores included, the principal of them being red hematite, in five kidney-shaped nodules, lead ores, accompanied by metallic lead obtained from them, and rather rich copper pyrites. But that which has chiefly interested us, and requires especial notice in this place, is the presence of 20 or 30 specimens of very good coal; and the person in charge of the cullection having had the kinduess to translate for us the labels, we are enabled to state the localities wheate they were obtained,

* See autr, p. 3. † Considerazioni sulle Geologia della Toscana, del Professori Cav. Paolo Savl e G. Menechini ; Firenze 1851.

All of these localities are distributed over a range of purpose of the legens along the three for the Black Son, the Son of Mornour, and the Arisiphelays, where it is, the Son of Mornour, and the Arisiphelays, where it is, the son of the Company of the Company of the Company in this part of the Turkish copyer. Tux whole number of Exhibitors whose contributions were brought under the consideration of the Jury of Class II, appears to bave been 270, of whom 152 were Foreign Exhibitors, and 138 English, or of the United Kingdom. Of these there appeared—as Exhibitors, chiefly or exclusively, of the following classes of substances:-Of collections of the larger chemical products, such as

the icioeral acids, carbonnte and bicarbonate of soda, chromates and prussiates of potssh, borax, chloride of lime, salts of ammonia, and metallic salts for the use of dvers and calico-printers, 31 Exhibitors; 22 Foreign, and 9 English. Of alum and other aluminous salts and sulphate of iron, 16 Exhibitors: 6 Foreign and 10 English.

Of yellow prussiate of potash and red prussiate of oush exclusively, 8 Exhibitors; 5 Foreign, and 3 otjoh English.

Of salts of ammonia, 4 Exhibitors; 2 Foreign, and 2 English Of artificial ultramarine, 16 Exhibitors: 14 Foreign,

and 2 English. Of ceruse or white lead, and exichloride of lead, 16 Exhibitors; 13 Foreign, and 3 English. Of oxide of zinc or zinc white, and other zinc colours, 7 Exhibitors; 5 Foreign, and 2 English.

Of iodine and the salts of kelp, 5 Exhibitors; 1 Fureign, and 4 English.

Of acctic acid and acetic mordants, 3 Foreign Exhibitors. Of acctate of lead, I Foreign, and 2 English Ex-Of particular mineral points and preparations to pre-serve wood, 6 Exhibitors; 4 Foreign, and 2 English. Of ciunahar 2, of litharge and minium 1, and of smalts,

3 Exhibitors; all Foreign. Of house-painters' colours and artists' colours, 11 Ex-hibitors; 4 Foreign, and 7 English.

Of liquids for staining and painting wood, and varnishes for wood, 5 English Exhibitors. Of calico-printers' colours and lakes, 19 Exhibitors;

15 Foreign, and 4 English. Of the products of the distillation of peat, 4 English Exhibitors; oils of bitumen and bituminous shale, 3 Foreign Exhibitors; ods of coal-gas tar, 2 Foreign, and 1 English Exhibitor; ods of resio, 1 English Exhibitor; parified animal oil, I English Exhibitor.

Of the rarer chemical products and substances recommended by their superior purity, chiefly intended for the use of scientific chemists, 4 Exhibitors; 2 Foreign, and 2 Eoglish.

Of collections of pharmacentical products, generally numerous, including the alkaline, earthy, and metallic salts used in medicine, alkaluids and other organic pre-

parations, 18 Exhibitors; 9 Foreign, and 9 Eoglish.
Of unmanufactured drugs, such as Freeds opium, dried plants, &c., including one general collection con-tributed by the London druggists, 6 Exhibitors; 1 Foreign, and 5 English.

Of medicinal infusions, extracts, and confections, 9 Ex-bibitors; 2 Foreign, and 7 English. Of cod-liver od and skate-liver oil, 5 English Exhi-

Of quinine salts, 3 Foreign; and of magnesian preparations, 4 English Exhibitors.

The following pharmaceutical products were each shown by but one Exhibitor: by Foreign Exhibitors, salicin, quinkline, phloridrin, santonin, cream of tartar, and tartarie acid. By English Exhibitors, superphosnon tartane acto. By Engine Familion, superpose-phate of iron, bearois end, chloroform, sugar of milk, decolorized gum-arabic, nioine and caotharidine, kousso, sumbul and matice, Iodian bacl, myrzbine, n untural mineral water, artificial mineral waters (2 Eshibitors), and surgeous' lint,

The following miscellaneous chemical products and preparations were also the contributions of their repreparations were also the contributions of their respective Exhibitors solvely: of Fuerging Exhibitors, boracle acid, phengherus, porcelain colours, dyed wool fitecks, while the contribution of the contrib feeting powder; preserved size, starch, gum, and other products of the potato; a material imported for dyeing black; a new brown colour; woods furnishing dyes, oils, and medicinal substances; illustration of ale and porter brewing; tinted paper for back cheques; parchments restored after iojury by fire; wood preserved by a peculiar chemical process; a marking ink; a centent, Pooloo's Chinese cement; restored cotton waste; washing blue; a varnish for labels and artists' designs, black-

ing and French waterproof varnishes.

The specimens of the larger chemical products exhibited from the British manofactories, were frequently un a magnificent scale, and of singular beauty; such as the ecvystallized citric and tartarie acids, the chromates and pressintes of potash, sal ammonise, alam, earbonnte and bicarbonnte of soda, and the sulphates of copper and iros. The pharmaceutical collections were also remarkably fine s or passumecutical confections were miso remarkably fine and extensive, including very beautiful preparations of iodine, of mercury, lead, zine, natimony, silver, portsh, and soda; double salts of irou; the salts of morphia, strychnia, and even the rare creatine and creatinine; while medicinal plants were so well preserved as to appear with all the beauty of the living plant. Several of the processes, also, were illustrated by instructive sories of specimens, exhibiting the successive steps of the manufacture; as the alum process by shales in different stages of decomposition; the different steps in the white lead manufacture; and others. Many fine specimens were also contained in the foreign collections, speciments were also contained in the foreign collections, in though generally smaller and less prominent. It was evident that chemical manufacturing had attained more subdivision in England than abrond, with larger individual production. On the other hand, the great variety of produces from a slagle naninfactory was often very striking in the foreign, particularly the German, collections; a variety without inferiority of quality, which hore testimony to the excellent chemical education and varied resources of the exhibitors

A great reduction in the cost of production is quite as remarkable in chemical substances as in the products of remarkable in chemical substances as in one present mechanical ingenuity, and equally indicates improvement to the absorbed as in the mechanical arts. The great staple articles, such as the mineral acids and the alkaline salts, have become available, from their cheapness, to a vuriety of new applications, which are gradually altering the aspect of chemical manufactures. Thus we now find of this application of the substance. solphurie acid applied directly to elay to form a sulphote of alumina, which competes with alum; and the sulphute of copper, the sulphate of magnesia, and even the sul-phate of iron, produced by the direct combination of their constituents. The ore of lead we see treated with the hydrochloric neid of the soda process to form a rival pigment to white lead; and the ores of copper and tin fosed with alkaline salts, as the means of purification and reduction, or to form a new salt.

Of a large proportion of the chemical products ex-bibited, the features which claimed most of the consideration of the Jury were the superior quality and beauty of crystallization of the salts, indicating a high degree of purity in their composition, and superior excellence of manufacture. Such may be said to be the general ground of the award of the hourary distinctions which have to be reported. But in a considerable number of instances the product was further recommended by its novelty, or hy some important improvement in its preparation, which demands more special notice.

RED ON ALLOTROPIC PROSPHONUS.

Of the elementary and non-metallic substances, an instance of singular interest was presented in the allotropic phosphorus of Schrötter, manufactured and exhihited by Messrs, J. and E. Stenars, of Birmingham (119, p. 199). The extraordinary conversion of phosphoras into a red infusible powder is effected by exposing melted phos-phoras in a close vessel, to a degree of heat which is near the boiling point of that substance, and which is kept up fur a considerable time. It is probable, from the entirely inodorous character of the specimens recently manufactured, that the amorphous phosphorus is now made with-out the use of sulphoret of carbon to rensove noy excess of unaltered phosphorus. This new preparation presents great facilities in the manufacture of matches, from being no longer spontaneously inflammable, and yielding nu snoke of phosphurous acid; which was found bighly in-jurious to health, producing caries of the bones, particularly of the lower jaw, in workmen exposed to it. larry of the namer jaw, or managed to proceed the combination of red lead with the amorphous phosphorus in the matches causes them to ignite as usual by friction.

IODINE.

Perhaps the earliest, as they are still among the most esteemed, manufacturers of iodine on the Continent, after its first discoverer, M. Courtois, are the Messrs. Counselle and Co., of Cherbonrg (462, p. 1200), who have created in their own sphere a branch of industry in the preparation of iodine, of chloride of potassium, and the other salts of kelp; of which specimens were exhibited, remarkable for purity and beauty. With the exception of the iodine used in photography, the whole iodine produced appears to be still consumed in medicine, and chiefly in the form of iodide of potossiam, and other iodides, only a compara-tively small quantity being retained as iodine. Of iodiar from kelp there are also two Scotch and two Irish Exhibitors, who are each considerable manufacturers. hibitors, who are each considerable manufacturers. The great increase in the prudoction of foldies took place about 1840. The make of u single house in Scotland, from 1843 to 1850, accraged 2276,000 one-sper annum, and is believed to furm fully one-third of the entire predoce of the United Kingdon during that period. prodoce of the United Edigition unions the pro-The price of a pure dry article for the three years, 1848, 1842, 1850, reminied between 74d, and 84d. The price for 1851 is from 6d, to 64d, with an excess

SULPHUBET OF CARBON.

Among the newest of chemical manufactures is that of Among the newest of chemical manufactures is that of orliphuret of carbon, represented by Ir. L. C. Manquaur, of Prussin (1.—327, p. 1669). This liquid has found a sin-gular application in electro-plating, the addition of a few drops of it to the silver solution causing the affect of the deposit bright, a five which appears to have been inde-pendently discovered by the Messrs. Etkington, and by Mr. Lyons, of Brirmigham, who both exhibit illustrations

BODACIC ACID.

The preparation of boracie acid by Count F. de LAR-DERES, of Tuscany (35, p. 1294), was rewarded by a Council Medal. Although this well-known manufacture is not receut, having attained its full development at least ten years ago, still the bold originality of its first conception, the perseverance and extraordinary resources displayed in its soccessful establishment, and the value of the product which it supplies, will always place the operations of Count de Larderel among the highest achievements of the useful arts, and demanded the most honourable recognition at this epoch. The vapour issuing from a volcanie soil is condensed, and the minute proportion of boracie acid which it contains (not exceeding 0:3 per of borasele sciel which it contains (not exceeding 02 per cent.) is recovered by evaporation, in a district without foel, by the application of volcanic vapour itself as a source of heat. The bornele acid thus obtained greatly exceeds in quantity the old and limited supply of borax from the upper districts of Hritish Halin, and has greatly extended the use of that salt in the glasses of porcelain. and recently in the making of the most brilliant crystal when combined with the oxide of zinc instead of oxide of

SULPHURIE ACID.

lead.

The most novel feature in the manufacture of sulphurie acid, illustrated in the Exhibition, was the process of making this acid in vessels of earthenware instead of the leaden chamber, as designed by M. FOUCHE-LEVELLETIER leaden chamber, no designed by M. FOUCHIS-LISPELLETTIN (1229, p. 1236), and followed to a large extent at the eele-brated works of Javel, near Paris. The nuterial of these vessels is the salit-glaze ware, which resists acids; and they are in the form of large Wolfe's bottles, connected together in series. The seid funes are carried through a large number of these vessels, hy which the power of con deceation is found to be one-third greater than could be obtained from a single chamber of equal capacity; while their uriginal cost of construction is, to that of a leaden chamber, in the proportion of 12 to 100, and the cost of maintaining them is nothing. Such vessels have been in use at Javel since 18 to; and of the large annual production of 3,600,000 kilogrammes of concentrated sulphuric seid in that establishment, one-third is at

present manufactured in this way. The acid thus pre-pared, is of course free from lead. The manufacture of pared, is of course free rivin reas.

vessels of the material described, for chemical purposes,
being greatly on the increase in England, the process of
Javel could be easily introduced, and appears well deserving of the consideration of manufacturers.

SALTS OF SEA-WATER.

A Conneil Medal was accorded to MM. Prat and AGABB, of Museilles (1682, p. 1257), for various salts, ineluding the chloride of potassium, sulphate of soda, and salphate of magnesia, prepared from sea-water, hy the pro-cess of M. Balard. The long-continued investigations of sea-water, hy the last-named eminent chemist, have fur-nished valuable means for the separation of its useful salts. It appears that the sea-water of the Mediterranean may be concentrated by spontaneous evaporation to density 1 27, without depositing anything but common salt. The mother-liquor, or bittern, when further concentrated, first deposits, as its density rises from 1'27 to 1'32, a mixed salt, consisting of about 40 parts of solphate of maxet sait, consisting of about 40 parts of surprate of surprate of magnesia and 60 parts of chloride of sodium. Or, if the temperature falls to 6° or 7° Centigrade (43° or 45° Fahr.), bittern of deasity 1'32 deposits sulphate of magnesia nearly pure, in the proportion of about 50° kdogrammes of that salt from one cubic nexter of fluid. grammes of that salt from one cubic metre of finid. The most economical application of this sulphate of magnesia is said to be in the conversion of chloride of sodium into aniphate of soda. The next important product obtained is, the double chloride of potassium and magnesium, which serves afterwards for preparing the children of the content of the content of the conthe ehloride of potassium. This double salt is deposited from the hittern concentrated to density 1:345, by spontaneous evaporation, after the deposition of the magnesian salts; or by concentrating by artificial heat in an eva-porating pan to the same extent. Dissolved in a small quantity of hot water, the double chloride undergoes decomposition, and allows the ehloride of potassium to erystallize nearly pure on cooling. The inst mother-liquor above density 1°345, after the reparation of the potash, contains much chloride of meguerium; a salt which may be had recourse to as a source of hydrochloric acid, being decomposed by distillation.

M. Balard has also proved that the greater portion of the sulphate in sea-water, separates, as sulphate of sods, from sea-water concentrated to from density 1'152 to 1 2, if cooled down to from -4 to -5 Centig. (25 to 23 Fahr.). Waters concentrated as far as density 12 to 1'264, produce an abundant deposit of sulphate of sods, even at-2' nr-3' Ceutig. (28' to 26' Fahr.). Sulphate of soda, however, is procured more conveniently by dis-solving together sulphate of magnesia and chloride of sodinm, in the proportion of 55 of the former to 45 of the latter, at the temperature of 30° Centig. (86° Fahr.), and running off the solution of density 1'264 into open reservoirs. Sneh a solution exposed during a cold night in winter, deposits a considerable quantity of sulphate of soda at 5 or 6° Ceutig. (42° Fahr.); about 85 per cent. of the whole quantity of that salt which it contains, at + 2 Centig. (35% Pahr.); and if the temperature fall to -2 (284 Fahr.), the solution deposits nearly the whole of the sulphate of soda present,

The most important of these products is, no doubt, the chloride of potassium, and M. Balard has, with good reason, looked to sen-water as the great natural source of potash. The water of the Mediterranean contains, ac-cording to the analysis of M. Usiglio, 0°0505 pound of ehloride of potassium in 100 pounds of water, or about one two-thousandth part of its weight of that salt.

BICHROMATE OF POTASE.

The biehromate of potash was exhibited to great advantage by Messrs. DENTITH (8, p. 187), and other makers. Prior to 1820, the process universally followed far the pre-paration of this salt was, to calcine chrome iron with nitrate of potash. Biehromote of potash appears to linve been consumed, at that time, in the preparation of chromate of lead only, and was sold at about 21s, per lls. The first alteration in the process was the addition of carbonate of

the latter salt was effected. The next great improvement made in the manufacture was the dispensing with nitre, and oxidising entirely by means of air admitted into the reverberatory furance in which the ore mixed with car-bonate of potash is ealeined. This change took place about 1835 or 1836. An addition of lime to the preceding materials was made by Stromeyer, in Norway, a few years afterwards, and soon became general. The oxidation goes on quicker with the presence of lime, owing to the porosity of the mass, which allows the more ready access of air. The earliest great manufacturers of this salt in the United Kingdom were Kurts and Niven, of Manchester, and Turnbull and Itamsay, of Gingow, who were soou followed by the Whites in Glasgow, Swindells in Neweastle, and Deutith iu Manchester,

The introduction of the yellow discharge (chromate of lead) upon Turkey-red cloth, by Daniel Koechlin, of Mulhouse, about 1820, appears to be the circumstance which first greatly increased the demand for this salt, and stimulated the improvement of its manufacture. Besides its familiar application, to produce the yellow and orange chromates of lead, bichromate of rotash is and orange chromates of lead, bichromate or porsan is now used in dyeing wool; a fast and solid black being produced by boiling the wool with hichromate and a little sulphuric acid, washing the wool in water, and afterwards dyeing with logwood in the usual way. Hy substituting other dye-stuffs fur the logwood, various substituting other aye-states for the logwood, various other colours are produced in a similar manner. The wool contains oxide of chromium, which acts like alu-mina or peroxide of iron in attaching colouring matters. Chromie acid has also been used in bleaching palm oil,

and in oxidising oils for other purposes,

The following statement (kindly supplied to me by Mr. J. White, of Shawfield, Glasgow of the entire production, during several quinqueunial periods, of one of the oldest and most considerable manufactories of hichromate of potash in Scotland, gives a fair idea, I believe, of the general advance of this manufacture during the period alluded to:—

THE PRUSSIATES OF POTASH.

These important salts were exhibited of great purity and beanty, by several manufacturers, particularly Messrs, T. Bramwell and Co., of Newcastle (27, p. 190); the HULET AND CAMPRIE ALUM COMPANY, of Glasgow (13, pp. 188, 189); the BOCWILLER MINING COMPANY, of France (376, p. 1195); C. SCHLIFFE, of Russin (27, p. 1367), and ALEXANDER HRUSGHIN (24, p. 1367), also of

The mannfactory of Messes, Bramwell was established about 80 years ago, at which time Premian blue only was made in it; a considerable quantity of which, I mu informed by Mr. Brunwell, was sent annually to China, and used by the Chinese, it was believed, for colouring green tean: a spring shipment was always made of about 2,000L in value, which was often followed by nnother in antumn. It was first sold at two guineas per pound, made up in neatly-finished our-pound packages, but had fallen, in 1815, to 10s, 6d., and about 1820 to 2s. 6d. For the last ten years the price of Prussian blue has been 1s. 9d.

Prossinte of potash was not known in commerce in a crystallized state till about 1825, when the price was 5s, per pound. But far some years previously a weak solution of the salt, or of the fluxed mass of animal mutter and potash, had been sold at 1s. per gallon. The process of manufacture, so far as regards the materials need and the furnaces employed, is still essentially the same as it was fifty years ugo; but in consequence of agitating the fluxed mass by machinery in closed pots, intreduced at Glasgow by the late Charles Macintosh, in 1824, and other minor improvements in the manipulation, the potash to the chrome ore and nitre, by which a saving of production of practiage from the same quantity of

animal matter has been increased threefold. The rapid progress of this manufacture will appear from the folowing estimated annual production in the United Kingdom:-Per Pound.

Annual Production :s. d. 5 0 From 1825-1830 about 10 tons, at 1839-1835 about 40 tons, at 6 1835-1840 about 200 tons, at 1840 -1845 about 700 tons, at 4 1845-1850 about 1,040 tons, at .

The number of prossiste works in the United Kingm is, at present, eleveo, the whole making, when the salt is in demand, about 20 tons per week, of which the two largest works, those of Messrs. Bramwell, and the Hurlet and Campsie Alum Company, are believed to produce four or five tons each. The value of the annual product for the last five years is calculated from the preceding data at 145,600%.

The most extraordinary event in the history of this manufacture is, the attempt made a few years ago to introduce the air-process, which is of much interest both in a scicotific and practical point of view. As cyanogen is rapidly converted into ammonia, the artificial formation of the former from the uitrogen of air would likewise furnish an unlimited supply of ammouia, of which the importance to agriculture could not be over-estimated. The experiment was pursued with singular perseverance and ability, as will appear from the following valuable details, for which I am iodebted to my friend Mr. F. R. Hnobes, of Borrowstownness:-

In 1844 we commenced a series of experiments upon the large scale, at Newcastle, in company with Mesers. Bramwell, to manufacture prussiate of potash without nainal matter, substituting the nitrogen of the at-mosphere for it, and continued the experiments till the latter end of 1847.

" In these operations a tube or retort of fire-clay was placed in a vertical position in a furnace so constructed that, when the formation of carbonic oxide was prevented, sufficient heat could be obtained to soften a Stourbridge fire-brick throughout its substance, wheo exposed in the flue, or off-go, to the full force of the fire.

"The lower part of the retort was made of cast-iron, kept oot of the vicinity of the fire, and of sufficient length to afford time for the mass heated by the fire to become cool before it was discharged into a cistern placed below, containing water and a protosalt of iron, into which the lower end of the tabe dipped. Provision was made at this end of the tube to regulate the periodical discharge of its contents, in whatever proportion was desired.

"The tube was filled with wood-charcoal, saturated with a solution of the carbonate of potash of commerce, and dried. The mixture in this state generally contained about 20 per eent, of potassa (KO),

"By means of an air-pump, the atmospheric air was drawn through the tube of alkalized charcoal, in a contimous stream from the top, and discharged below in the state of nitrogen and carbooic oxide.

"The alkalized charcoal was thus found to become pretty rich in eyanide of potassium; one-half of the alkali of the cyanized charcoal frequently being found, upon testing, to be in combination with cyanogen; so that when all was working well, 36 to 40 ewt, of prus-siate of potash were produced in a week by means of seven to eight retorts, of 10 to 12 feet long in the fire. and 2 feet internal diameter.

" In our first experiments much narrower tubes were employed, to which the heat was applied only externally; but as both the tubes and charcoal are bad canductors of heat, we could not operate upon sufficient quantities, and we found it necessary to build larger tubes, with fire-hricks, of the above dimensions; leaving a circle of small apertures or chiuks in the tube, every third or fourth tier of bricks, through which the intensely-heated gaves, if tropen and earbonic ucid, were drawn from the flue surrounding the takes, by the action of an aspirator, it were the takes to the theory of the large tubes

so hot, that an iroo rod one inch in diameter became white hot when thrust down in the centre and allowed to remain there five or ten minutes.

"Our next improvement was to use the alkalized charcoal undried, and to aspirate the air from below upwards, instead of downwards; the surplus heat drying the alkalized charcoal before it reached that part of the retort in which the cyanide was produced, a length of 6 to 8 feet. The top of the retort was in this case rendered air-tight, and the cyanized mass discharged below as before.

" Through seven or eight retorts of the above size about 2,400 cubic feet of alkalised charcoal were passed in n week; and about 1,200 to 1,400 cubic feet of evanized charcoal were obtained, nearly one-half of the charcoal

being consumed.

" There were two great drawbacks to this process; one, the immense quantity of material to be lixiviated for a small return of prossiste; the other, and by far the more important, an extraordinary waste of potash in the process, npwards of three parts by weight being consumed in producing one of prussiate. The whole of this waste could never be properly accounted for. About one part was, of course, recovered in a state of prussiate. It was found that another was lost in the small refose charcoal, which that another was lost in the small relose custrous, wases could not be lixivisited to pay, and the remainder appeared to be partly combined with the bricks of the retort, and partly dissipated up the eliminey.

"In 1847 we abondoned the experiment, after a loss of many thousand pounds. But we proved the possibility

of producing large quantities of eyanide of potassium, by drawing intensely-heated nitrogen and carbonic acid gases through a mixture of potash and charcoal, with the diffi-culty of carrying this out as a manufacturing process

from the great waste of potash.

" Our experiments were more directed to making the air process practicable, for the purpose of manufacture, than to ascertain upon what principle the formation of cyanogen depended; for it was immaterial, in a mann-facturing point of view, whether the cyanogen were produced from the nitrogen of the atmosphere, or from the ammonia which the charcoal was always found to contain. The means of nicely observing the changes were lost from the necessity which existed in operating upon large masses, to draw the intensely-heated gases from the fire into the body of the tubes, in order to bring the alkalized charcoal to a proper heat for the production of eyanide of potassium. It is probable that some part at least of the eyanogen was furnished from the ammonia in the charcoal, which in separate experiments in the laboratory, was found not to be entirely given off at a red heat. Some al-kalized charcoal, also brought to a proper heat in a porcelain tube, produced a considerable quantity of eyanide of potassium without the presence of air, the ends being stopped up. On the other hand, when the retorts were filled with charceal not alkalized, and the heated gases drawn through, no formation of either eyanogen or hydrocyanite of ammonia could be detected.

"A paper, by Professor Marchand, contained in the eighth volume of the Chemical Gazette, page 301, on the presence of nitrogen in cast iron and steel, appears to throw some light upon the subject. He has shown that when carbon is combined chemically with iron, and treated with potassium, in the presence of nitrogen, eyanogen is with potassium, in the presence of nitrogen, eyanogra is produced. It seems to me, therefore, probable that the first step in our process was the formation of a carbaret of potassium, which by combining with the aspirated nitrogen, produced the eyanide of potassium. This might be ascertained by examining the remainder left in the retort, after the production of potassium in the ordinary way from bitartrate of potash, testing the quantity of cyanide it contained, if any, and then testing the increased quantity after heating it is nitrogen gas.

"I have only further to mention that we substituted soda for potash, in the process, with the like loss."

Mr. Bramwell also considers that the process succeeded perfectly, in a chemical point of view, although combined action of the alkali and of the excessive heat

commined acrois of the lakin and of the excessive near applied.

In 1842-43 the use of the red prussiate of potash in calleo-printing was introduced, and since that time a considerable and increasing quantity of the yellow prussiate.

has been converted by means of chlorine into that salt.
Shortly afterwards both salts were successfully employed in "de laine" printing, as well as in dyving wood;
the blue from the red prussiate being found more durable
when fixed by peroxide of tim. The red salt is also
mixed with wood colours, to stidles them, or produce

CARBONATE OF SODA.

Few chemical processes have maintained their ground for no long a period as the grand process for the preparation of carbonate of soda from Ciloride of sedimis, by interesting the process of the preparation of the interesting the process of the preparation of the latter sait by coal and carbonate of line, upon the floor of the reverberstory furnace. The instructions given by Leblans, who invented this soda-process at the end of the present day, "might still be alone as directions at the present day,"

All the carbonate of soda produced in the United Kingdom by this process, up to 1825, was scut into commerce in the form of the crystallized carbonate only The manufacture was advanced into importance chiefly by the skill and exertions of the late Charles Tennant, at the great chemical works of St. Rollox, near Glasgow, The salt is, in consequence, known in London, to the present day, as "Scotch sodn." The crystals were sold in 1820 at 35s. per ewt., but the price descended gradually in three or four years to 20s., partly in consequence of the increasing demand, at this time, for bleaching powder, giving rise to the formation of much solphate of soda; and partly from the great reduction in the price of com mon salt, arising from the increased production which followed the abolition of the Excise duty upon it, although a drawback of the duty had always been allowed upon the salt consumed in this manufacture. The price of crystallized carbonate of soda, at the present time, is about 6s, per cwt. About 1823, the soda-ash trade was originated in Liverpool, by the enterprise of James Muspratt, and soon extended to Newcastle, which is now the principal seat of the manufacture, and to other places. When, formerly, the production of carbonate of soda was combined with that of chlorine, the binoxide of manganese was mixed with the common salt and sulphurie acid, which involved an after-operation for the separation of the mangauese; but now, the hydrochloric acid is first separated by the action of sulphuric scid upon chloride of sodium slone, in a peculiar form of the reverberatory furnace, and condensed in a stone tower, filled with moistened pebbles, through which the vapours are conveyed; while the chlorine is evolved by the direct action of hydrochloric acid upon manganese, in excavated vessels of sandstone, which are heated by steam applied ex-ternally. Depending also, as this soda process does, upon the economy of the sulphnric acid manufacture, it upon the economy of the sulphiric seed manuscoure, it was greatly benefited by the improvement introduced into this country, about 1828, (by Kestuer, of Thann.) of throwing steam into the leaden chamber, by which the full equivalent of sulphiric acid cause to be obtained for the sulphar consumed. The consumption of nitre, or of nitrate of soda, was also reduced, by the proper management of the chamber, from one-siath to one-twentieth of the weight of the sulphur, independently of the appli-cation more lately made by Gay-Lussac, of strong sulphurie acid to absorb and recover the nitrous fumes which are usually allowed to escape with the exhausted air of the chambers.

The attempts of chemists to modify or entirely supernede the sold-sprocess of Lebhane have been increasant, and of the most diversified character. One of the latest of these is the process of Mr. Loxoxaxin, (C. l., 441, p. 162), for decomposing common salt by means of iron pyrrites, which appeared to the Jury to layer that amount

of success which, considering the difficulties to be mounted and the findencinal character of the sold mounted and the findencinal character of the sold sold containing two or three per cent of report, subject or down was recumined by the painted of the containing two or three per cent of report, subject or down was recuminedly produced by the guitton of the containing two or the second by the guitton of the copies contributing to the profit A process, also, like opportunities of the profit of the pro

ZINC-WHITE.

The introduction of sake of size, as or white paint, in the place of a sail of fast, in our of the next remarkable the place of a sail of fast, in our of the next remarkable application, first ascendify made in Prance, in people creating on the Content, and due in Papaland. An other particular of the production of the people of the place of the production of the most in size. This could, in the production of the most in size of the place of the production of the most in size of the place anguestic, gives a passe which occur well, and has the lattice. The write of this of people of the children has been proposed by barming the most, as it is first crotect which could be a production of the production of the production.

GARANCINE.

A considerable portion of the madder roots, instead of being ground and exported in that form, as heretofore, is now exposed, ofter being moistened with dilute sulphurie seid, to a boiling heat by means of steam, by which the quality for some dyeing processes, while the quantity rendered soluble in water is greatly increased. The madder so prepared is known as garancine, and forms an important branch of manufacture in the south of France, which was well illustrated by o collection of specimeos supplied by the Chamber of Commerce of Avignon (1049, p. 1229). The spent madder, after being used in dyeing, is now also converted by Mr. H. Steiner, of Accrington, into a garancine (termed garancesse by the French) by steeming it with sulphuric acid in the same manner as the fresh madder, and thus a considerable quantity of colouring matter is recovered and mode ovoilable which was formerly throws away is the spent madder. vorieties of garancine give a more scarletty red than the naprepared madder, and also good chocolate and black, without soiling the white ground, but are not so well fitted, particularly the graneine of spent madders, for dyeing purples, lilacs, and pinks.

LIQUID PRODUCTS FROM THE DISTILLATION OF COAL AND PEAT.

The condensable predicts from the distribution of real out-of-the himmings antidence are becoming every day more important, from their vories anythesized. The most inportant price is the residence of the contraction of the contraction of the conference of the price is the contraction of the foreign and the contraction of the contraction of space filling the pixel to written half on inche of the tensor course, those three questions of an inches of the tensor contraction of the contractio naphtha is also used for external lighting, the wurking sheeds and yards of some manufactories being thus brilliantly illuminated. The naphtha is then burnt in the lamp invented by Mr. Beale, in which the ignition is promoted by a jet of air transmitted from the fan-blower or other blowing-machine.

The volatile shall of the ammenical liquer is now generally streamly with sulpharie call and crystallized, generally streamly with sulpharie call and crystallized, support of the sulpharies of the sulpharies of the sulpharies volatile state of manuscile, and condensing in subpairs and. All the erabonate conserver is the first fourth of the sulpharies of the sulpharies of a manuscile that the sulpharies of the sulpharies of a manuscile of the sulpharies of the form 124, to 144, per tone, it used in almost and the caroperature, we converted into and assumed and the caroperature, we converted into and assumed and the carquisition of the sulpharies of the sulpharies of the sulpharies and was not illustrated by N.F. C. Blazz, of Deptical sulpharies of the sulpharies of the sulpharies of the claim (Rupplom and Pergeng State,

The Chemical Jury likewise extended its commendation to all the chiliston of the products of the distillation of peat, although properly belonging to Class I. Prize Medals were also awarded to A. Wissaxa and Co., of Prussia (334, p. 1010), for the products of distilled schist; to to A. Monxax, of France (1361, p. 1241), for a series of products of distilled bitumen; and to J. Yozxa, of Manchester (7a, p. 187), for pranfill and olds obtained

The process last referred to is one of great importance, which has only been fully developed since the Jury made its awards. By distilling the cannel coal of loghested, Vennet it said to death as quantity of oil, amounting to load to a death of the venture of the everyth of the coal. This oil, after recriting of a small portion of its more volatile parts, or exceedingly well adapted for labelesting machinery. In the company of the control of the everyth of the coal of the venture of venture of the venture of th

Such were the principal navelries in the chemical department of the Exhibition. But there is reason to believe that many anhataness boildes those already described were the results of improved processes, peculiar to their works of the properties of the properties

The following enumeration of the principal Exhibitors, in Class II, contains, with a notice of their contributions, a statement of all the awards both of the Prize Medal and of the distinction of Honourable Mention which were made by the Jury.

ARMANY ROOTMON OF THIS (7, p. 1302), obtained

Albant Boothers, of Turin (7, p. 1302), obtained Honourable Mention for a collection of chemical products of good quality, including the mineral neids, intrate of baryta, gelatine, and soda-soap.

— ANTHELME, of Andeim (Aime) (1541, p. 1250), obtained Honourable Mention for alum manufactured by him.

P. H. Auberdier, of Clermont Ferrand (754, p. 1216),

P. H. AUREADIZA, Of Clermont Ferrand, Cry. p. 1210; exhibited French spium, prepared by a method of incision invented by hinself; and also the syrup of lettuce. H. F. L. AUGUSTIN, Of Halberstadt (825, p. 1095), obtained Honsurable Mention for the good quality of bis acetate of lead.

JAMES B. APSTIN, of Banbury (114, p. 199), exhibited decoctions and infutions of medicinal substances, prepared by him.

THE CHAMBER OF COMMERCE OF AVIGNON (1049, p. 1227) had the Prize Medal accurded to it for garmacine; a valuable form in which madder is prepared, and which is manufactured largely in the south of France, where madder is cultivated.

F. Bankart and Sons, of Swanes (49, p. 193), exhibited copperss, manufactured by them in that locality. James Benjamin Idaness (45, p. 192) had the Prizo Manufacture of the local by means of chromic acid, exhibited, together with a series of the valerizates of the sikaline, earthy, metallic, and organic bases, of singular

extent and completeness.

James Hass, of Hatton Garden (95, p. 197), exhibited specimens of the concentrated medicinal infusious and decortions which he prepares, and which are much

esteemed in the trade.

steemed in the trade,

we steemed the steemed glass apparatus, specimens of tungstic acid, oxide of uranium, and of the rarer netallic oxides, together with selentium to great quantity; for which collection of chemicals the Prize Medal was awarded.

Manuer. Groode Bell and Co. (66, p. 194) exhibited mineral paints, compounded so as to dry quickly under water, and to remain attached to metable exposed to extreme heat, ISAAC LOWTHAN BELL, of Washington Chemical Works, Newcastle-upon-Tyne (12, p. 488), exhibited specimens of Pattingon's patent oxichloride of lead, with illustrations's patent oxichloride of lead, with illustrations oxichloride oxichlori

John Brita and Co. (116; 2, 199°, of which firm Mr. J. Bell, Juno of Class II, is a partner, shallisted several pharmaceutical products carefully prepared by them, including cod-liver oil, the stearize from that oil, simple and compound extracts of sarvaparilla, oil of lavcoder, beausous of ammonia, icolide of irou, extract and incurrent

of Indiau hemp, juice of taraxienu, &c.
PILTIO BEGACIJA, of Venice (34, p. 1008), obtained
Honourable Mention for his white lead, litharge, and
veriligits.

Biscitor and Riddies, of Bonn (312, p. 1668), had the Prize Medal awarded to them for their white lead, which was remarkable for its density and great onesity.

was remarkable for its density and great spacity. Professor S. Bleensone, of Dedft, and K. Entroven, of the Hague (1, p. 142), had the Prize Medal awarded to them for their excellent white paints manufactured from oxide of zine. They exhibited also a yellow chromate of zine, chloride of zine, and a pigment which was named green oxide of zine.

L. BLEIDTERSU, of Bonn (313, p. 1068), nbtained Innourrable Mention for good potass-shun. The Bloom Inguite me is obtained by burning together a highly pyritous lignite and clay, which yield the potash as well as the other constituents of the salt, BLENDELL, SPENCE, and CO. (48, p. 192) had the Prize

Medal awarled to them for their painters' column, of which they exhibited a most extensive and beautiful collection.

A. Bo, of Turin (19, p. 1303), exhibited a very select

A. 15, of Turn (19, p. 1393), exhibited a very select collection of lakes and mineral colouds. Honek (Widow) and Lexing, of Choisy-le-Roi, Seine (1992, p. 1230), had the Prize Medal awarded to them for the acid obtained from the distillation of wood, and its aslat, which they exhibited. Their allowing sestimation is

the act comments that the property of the property of the which they exhibited. Their placial accide neid remains adial at 60 Fabr. This collection included the eils from collection and the property of the

fract of the Sacos command appears to indicate, prepared according to the prescription of the exhibitater. Boox and Sox, of Boblinger, Wartenburg (2, p. 1114), exhibited good loidle of potassium, and erecacte frem tar.

Boos, of Warsaw, Poland, exhibited alum which merits

Hoss, of Warsaw, Poland, exhibited alum which merits commendation.

The Chemical Manufactory of the Polawillen

MINING COMPANY (376, p. 1195), under the direction of M. Schuttenniann, had the Prize Medal awarded to it for fine specimens of alum, prussiate of potash, and glue, Sulphate of iron was also exhibited.

J. Bowrs, of Humlet, Leeds (42, p. 191), exhibited carbonate of soda, pure and neutral in composition, and thereby particularly adapted for scouring wool ur woollen goods, as it removes grease without injuring the animal

T. Branwell and Co., of Heworth Chemical Works, Newcastle-npon-Tyne (27, p. 190), and the Price Medial accorded to them for prussite of potash; of which salt they are amongst the oldest producers in England. E. Brassens, of Belgium (42, p. 1153), received Ho-

nourable Mention for his white lead.

Baasseura and Co., of Nippes near Cologne (314, p. 1068), contributed specimens of white lead remarkably white and dense.

white and deuse.

G. J. Harun, of Prague (21, p. 1080), obtained Honourable Mention for his prussinte of potash and stannate of soda.

of soda.

WILLIAM ARTHUR BREADEY, of Douglas, Isle of Man
(80, p. 195), exhibited a refined oil, which is recommented for watches and flue machinery, from having no chemical action on metals, and not being thickened by cold.

— Висигова, of Kirchheim, contributed a great display of ultramarine from Germany.
A. Butkus, of Paris (438, p. 1199), obtained Honourable Mention for his arsenical preparations, including

are nic acid, and very fine Branswick green.

F. X. Baowene, of Prague (22, p. 1108), exhibited a fine collection of chemicals, including succinic acid and the oxides of chronium and uranium, for which the Prize Medal was awarded.

BRONELL, of Frankfort, exhibited a colourless oil from gas-tar, chiefly beazole.

— Brown and Co., of London (7c, p. 187), had the Prize Medal awarded to them for their salts uf ammonia,

Fig. 3 deals aware to them as a contrast by an authorized to them as the contrast by the contrast of the particular to force and the property of the property of the property of the contrast the contrast of the contrast of

give body to various paints (browns, yellows, reds, blues, and greens).

ALEXANDER BRUSOHIN, of Koselsk, Russin (29, p. 1967),

received Honourable Mention for the excellent prassinte of potash which he exhibited,

W. Bienesse, of Pianesadt near Darustadt (1, p. 1125), had the Prize Medal awarded to him for ultramarine, of which he exhibited the greatest variety. The Theoretes of the Late J. Beckley, of Manebester (4, p. 185), exhibited sulphate of iron, which obtained Honourable Mention for its purity and superior quality.

Honourable Mention for its partly and superior quality, Enwann Brutzer and t²o, of Galway (37, p. 1), exhibited various preparations from sea-weed, including suits of potas and sods, rough and finely-explaint iodine, includes of potassium, lead, and mercury. Alors Lazors Brutzers (34, p. 19) had the Five-Weels Johns Lazors Brutzers (34, p. 19) had the Five-Weels Johns Lazors Brutzers (34, p. 19) had the Five-Weels Johns Lazors Brutzers (34, p. 19). The characteristic reports of characteristic properties of the considerable quantities and of good quality; especially restation, to the extent of

several ounces, erestinine, calfeine, allentoin, uric acid, hippuric acid, and urea.

Symmus John Burn (85, p. 199) had the Price Medal accorded to him for his beautifully-crystallized cantharidin, the blastering principle of cantinarides, as obtained by solution or sublimation, and in combination with the bases potash, soda, and oxide of fead.

Chromas Berrov (3, p. 185) exhibited a remarkably varied collection of saits and acids, chiefly for the new of scientific chemists. The collection included potass, coda-, ammonia-, and chrome-alum, finely erystallized; pure iodine, brosnine, &c., which received Honourable Mention.

F. Calloud, of Annecy, Sardinia (11, pp. 1302-03), obtained Honourable Mention for excellent phloridzin. He exhibited also santonia and morphine.

CAPPELEMANS, DERY, and Co., of Brussels (37, p. 1152), had the Prize Medal awarded to them for a large collection of salts, intending pids suff, generally of superior

Louis Francots Cesceutt, of Paris (793, p. 1218), exhibited specimens of dyed and milled wool, flocks, and paste-colours for paper-hangings, for which the Prize Medal was awarded.

John Cheshine, Jun., of Northwich, in Cheshire (20, p. 199), represented the salt manufacture, by a pyramid of best table salt, with several other specimens. The salt-mines and springs in Cheshire are worked to n greater extent than any others in Europe, their annual produc-

tion being upwards of 800,000 tons.

G. CLIFFORM (26, 189) of hatiated Honourable Mention for his successful efforts in restoring deeds, writings, books, maps, engravings, &c., which have been injured by fire. The process was not communicated to the Jury, but specimens of engraved documents and leaves of books were

Inc practos was not communicated to the duty, our specimens of engraved documents and leaves of books were exhibited, with one-half of them restored without separation from the injured portion. The unerstored portion was leard, horny, and brittle; the restured portion clean and flexible.

EDWARD COMPALD (Cl. I. 228, p. 143) obtained Ho-EDWARD COMPALD (Cl. I. 228, p. 143)

EDWARD CORDALD (Cl. I. 228, p. 143) obtained Honoursble Meation from various products derived from peat, E. E. Coernies, of Ornaienburg, Prassia (12, p. 1048), had the Princ Modal necorded to him for his prassiate of potash. This is one of the largest manufactories of that salt in the north of Europe. The annual production is about 130 tens.

Cotiner and Son, of Lyons (1153, p. 1233), obtained Honourable Mention for phasphorus of superior quality, with prussiate of potash and glue, which they exhibited. M. A. C. Collan, of Paris (801, p. 1219), obtained Honourable Mention for the products of coal far.

ROBERT NELSON COLLING (109, p. 198) exhibited the disinfecting powder prepared by him. This powder consists of a mixture of ehloride of lime and sulphate of alumina, and is highly efficacious in many circumstances, but must not be hrought, either dissolved in water or dry, into contact with metals.

MRc. ANNA COLVILLE, of Paris (802, p. 1219), exhibited a complete set of highly-valued colours for painting on porcelain, for which the Prize Medal was awarded.

W. CONAAN, of Paris (1156, p. 1233), had the Prize Medal was awarded awarded to him for the general excellence of his chemical products, which included purified iodine, iodide

of polassium, and refined campbor.
Thomas Aissler Cook, of Newcastle-upon-Tyne (15, p. 189), received Honourable Mention for one of the fines pecimens of crystallized carbonate of soda exhibited (masses).

nufactured by the Walker Alkali Company).
WILLIAM COPNEY (118, p. 199) obtained Honourable
Mention for a collection of remarkable fine single crystals
of chrome alum, sniphate of magnesia, sulphate of copper,

and several other salts.

Jony Corrocx, of Bridport (65, p. 194), exhibited a chemical liquid for imparting the colour of mahogany and rose-wood to common woods.

and rose-wood to common woods.

G. Consnit, of Tuscany (33, p. 1293), had the Prize
Medal accorded to him for sulphate of quinine and wellerystallized santonin, in large quantity, exhibited by him.
COULSON, JUKES, and Co. (72, p. 195) exhibited mineral
substances used in the manufacture of points.

COMENSAIN and CO., of Cherbourg, France (482, p. 1800), had the Prize Medal awarded to them for their chemical products derived from kelp, particularly iodine, which, it said, they ubstained finely erystaffized by a single stabilimation; iodide of potassium, chloride of potassium, subpinto of potash, &c.

— Courtial, of Grenelle, near Paris (807, p. 1219), had the Prize Medal awarded to him for his assortment of ultramarines, which fully maintain, by their superior quality, the high reputation of the French manufacture. J. Cerrice, of Duysbarg, Prassia (488, p. 1276), was one of the exhibitors of ultramarine distinguished by a Prize Medal.

DAUPTAIN, GORTON, and Co. (63, p. 194), exhibitors of ultramarine, had the Prize Medal accorded to them for the beautiful samples of their manufacture.

JOHN TRIFFLEWOOD DAVESTORY (111, p. 198) had the Prize Medal accorded to him for a pharmaceutical collection, which was chiefly distinguished by the hrilliant lamelle in which several of the metalic salts were exhibited. The sulphate of quinter and bydrochlorate of

bited. The sulphate of quintae and mydroculorate or morphia were in beautiful crystals.

Jons Davies, of Munchester (70, p. 195), exhibited preserved size, clear and strong, suitable for any climate.

DAVY, MACEMURDO, and Co. (62, p. 194), received the Prize Medal for the pharmaceutical products manufactured by them, including carbonate of anamouia, calomel, cor-rosive sublimate; benzoic, citric, gallic, and uxalic acids; acetate of ziuc, nitrate of silver, chloride of barium, astrate of baryts, tartar-emetic, of which the crystals were particularly fine; sulphate of soda, nitrate of ammonia, scetate of lead, sulphate of mercury, red oxide of mercury, glycerine, and pyroxauthin. The specimens were all glycerine, and pyroxauthin, remarkably good.

DEBRAUDT BEOTRESS, of Courtrai, Belgium (39, p. 1153). exhibited white lead of excellent our DE CAVAILLON, of Paris (109, p. 1176), obtained a Prize

Medal for salt of ammonia, prepared in the purification of Coal-gas.

V. DELIGNOU, of France (1180, p. 1234), exhibited rec

tified products of the distillation of bituminous shale, a chenical manufacture which has attained more success in France than in England, probably owing to the shales of the former country being less contaminated with sulphur than those of the latter, An Honomrable Mention was awarded to the exhibitor. W. DENTITH and Co., of Manchester (8, p. 187), had the Prize Medal awarded to them for the products of their

manufacture, by which the Exhibition was embellished: beautiful and colossal specimens of chromate and hickromate of potash, ferrocyanide of potassium, alarm from the Whithy shale, uitrate of lead, fine green oxide of chrominm, and oxide of zine.

DAVID DICK and Co., of Burgh Chemical Works, Carlisle (7 p, p. 187), exhibited copperas manufactured by

Spence's patent process.

Dirier, and Co., of Snalfeld (824, p. 1095), contributed superior oil and water colours for pair Dennerous and Co. (51, p. 193) exhibited magnesium

salts and their fluid magnesia (a solution of carbonate of magnesia in carbonic acid water). Dixon, Son, and Co., of Newton Heath, Manches (126, p. 199), exhibited specimens of matches made with

Schrotter's amorphous phosphorus, which are said to be as easily and cheaply made as the common matches. George Dickson and Co., of Edinburgh (79, p. 106), exhibited specimens of cod-liver, skate-liver, and ling-liver

oil manufactured by them. - Droop, of Osnabruck, exhibited mineral colo DROUN and BROSSIES, of Labriche, near St. Denis (169, p. 1081), had the Prize Medal awarded to them for the peculiar excellence of their colours for the use of calico-

printers. WILLIAM L. DUNCAN, of Sydenham, Kent (76, p. 195).

exhibited cotton waste before and after being used in cleansing machinery, to illustrate his process of restoring that substance. DUNCAE, FLOCKHART, and Co., of Edinburgh (104, p. 198), exhibited a specimen of chloroform, manufactured by

them, which appeared to possess a high degree of purity.

C. A. Dunots, of Hirschberg (Cl. I. 7 Zol., 1048), obtained flonourable Mention for a fine specimen of cinnabar, intended for sealing-wax.

L. Deroun, of Genoa (13, p. 1303), had the Prize Medal warded tu him for his salts of quinine, of which he exhibited the sulphate on a large scale, and the citrate THE ELECTORAL BLUE COLOUR WORKS, OF Hesse, Schwartzenfela (465, p. 1077), received Honucrable Men-

tion for beautiful samples of smalts, accompanied by other preparations of cobalt, and for ultramarine. ELLAM, JONES, and Co., of Derby (58, p. 193), obtained Honourable Mention for a considerable cullection of mineral and vegetable pigments manufactured by them.

SANCEL ESTCOURT (64, p. 194) exhibited specimens of washing-blue.

J. Evans (5, p. 185) exhibited finely-erystallized naphthaline from coal-tar, GEORGE EVANS (Cl. I. 227, p. 143) obtained Honourable

Mention for his numerous peat products.

BENJAMIN FAWCETT (29, p. 190) exhibited plain and ornamental specimens in graining or flatting, said to be Produced by a kind of paint free from noxious effluria.

The Firm of Fouchk-Lefellaria, of Javel, near Paris

(1229, p. 1236), had the Prize Medal awarded to it for a

rich and elegant display of alkaline and earthy sults, accompanied by pure mineral scids; the sulphuric acid being manufactured in a peculiar manner. Aumonized salts are also prepared from urine for manuring purposes, SOCIETE DE FLORETEE, OF Flureffe, near Namor, Belgium (38, p. 1152), obtained Honourable Mention for a good collection of the urdinary chemical products mannfactured by them.

John P. Fowler (55, p. 193) obtained Honourabic

Mention for the pure benzoic seid manufactured by him. Fox and Baratrotton, of Manchester (44, p. 192), obtained Honograble Mention for a series of the larger chemicals, of which they are mannfecturers; including common salt, sulphur, salt-cake (sulphate of soda , barilia or black-ash, soda-ash in illustration of the soda process; blenching powder, nitrate of lend, fine crystals of chlorate of potnsh, bisulphate of soda, protochloride of tiu, sulphate and nitrate of copper, the two prussintes of potns, with white, mottled, and vellow soda-scops,

H. Gabenann, of Schweinfurt, Bayaria (12, p. 1099). is one of the German exhibitors of ultramarine to whom the Prize Medal was awarded.

GATTER-BOCCHARD, of Paris (1245, 1237), obtained Honourshie Mention for various colours manufactured by him.

Gonraev and Cook (92, p. 197) had the Prize Medal accorded to them for their pharmaceutical products; among which their carmine and lake from cochineal, and car-

bouate of ammonia, were most remarkable. SEPTIMES II. Godson, of Tenbury (50, p. 193), exhibited the mineral waters of that lucality, with the bromine

and salts extracted from them T. GREENISH (124, p. 199) exhibited a soluble sur w. Gating, jun., of Berlin (43, p. 1050), exhibited

prepared colours containing the mordant by which wool can be dyed in one operation, without boiling. process was illustrated by samples of well-dyed wool.

J. B. GUINET, of Lyons (1620, p. 1256), had the Council Medal awarded to him as the original discoverer of artificial ultramarine in 1828, and as being still one of the most successful manufacturers of that substance

Gunzamano, of Stettin, exhibited white lead of good GUTHEIL and Co., of Dusseldorf (459, p. 1077), exhibited pure ferrocyanide of potassium.

Härnell and Ellis, of Manchester (10, p. 187), had

the Prize Medal accorded to them for a good collection of metallic salts, chiefly for the use of calico-printers; partienlarly the oxide, nitrate, and sulphate of copper, the oxides and most common salts of lead and tin, sulphate and hydrochlorate of ammonia from gas liquor, and the preparations of archil. The metals, named with their ores, and the commercial varieties of sulphur, were also well illustrated.

Jostan Hall, of Queenborongh, in the file of Sheppey (40, p. 191), exhibited copperss crystallized in a granulated form, convenient for dry mixing. It is prepared from the river pyrites, of which about eight tons are consumed

weekly. . W. HATTERSLEY (110, p. 198) exhibited an elixir of sarsaparilla, said to be prepared without beat. JAMES HAWTHORNE (39, p. 191) exhibited a new ink for

staining oak and mahogany, with illustrative specimens.
P. Havrs and Co., of Salford (75, p. 195), obtained
Honourable Mention for various products manufactured from resin, including spirits for making varuish, chear oils for machinery and tramways, &c. HEINZEN, BROTHERS, of Tetchin, Austria (26, p. 1008).

had the Prize Medal awarded to them for their cudbent and archil. A fine assortment of red and violet extracts was exhibited

A. and W. HENINGWAY (24, p. 190) had the Prize Medal accorded to them for their double salts of iron, ferric tartrates and citrates, and other pharmscentical preparations, which are extremely well prepared.

HENER, of Lichtenstein, near Osterrode, exhibited white lead commendable for its colour, Baron FRANCIS PAUL VON HERBERT, of Klagenfurt and Wolfsberg, Carinthia (30, p. 1008), the distinguished ma-

nufacturer, had the Prize Medal awarded to him for a collection of samples of white lead of excellent quality, Baron I, von Heaugar, of Klagenfurt, Carinthia (32, p. 1998), received Honourable Mention for his varieties of orange and bright red lead, and red and gold litharge. These colours possessed a brilliancy which was not ex-

eceded in any other collection O. HERMMANN, of the Chemical Manufactory (formerly Royal) at Shönebeck (Cl. 1, 683, p. 1088), had the Prize Medal accorded to him for on extensive eollection of preparations, which appeared in general to be chemical preparations, which appeared in general to be remarkably good. In the number may be mentioned giacial phosphorie acid of singular beauty, bromiue, hisul-phide of carbon, pure carbonates of potsab nul soda, free from silica and chlorine, for scientific chemists, pure gallie acid for use in photography, dec. J. F. Heyv. and Co., of Charlotteshurg, near Berlin chemical

(44, p. 1050), exhibited colours for paper-hangings and nainting; besides acetic acid, acetate of soda and acetate of lead manufactured from pyroligueous acid, at a very

F. C. Hills, of Deptford (23, p. 190), had the Prize Medal accorded to him for sal-aumoniac and earbonate of numuouia, of which he is a well-known manufacturer, The farmer salt is prepared by the addition of muriatic ocid to the ammoniacal liquor of gas-works, and the latter salt by the decomposition of sulphate of unitnoins by means of carbonate of line. Nitrate of potash was also exhibited, prepared by the decomposition of the chloride of potassium of kelp by means of nitrate

of soda. Hinsest and Baornes, of Portugal (50, p. 1307-08), exhibited a fair collection of neids, salts, and other chemical

products. HIBSCHMANN, of Warsaw, Poland (26, p. 1367), represented the chemical industry of that city by a collection

J. Hormstager, of St. Procopi Mineral Works, Kahn Bohemia (14, p. 1007), exhibited alum and snlphate of iron of good quality.

Horkin and Williams (41, p. 191) were accorded the

Prize Medal for an interesting collection of the rarer chemicals used in medicine, particularly pure acoustine, a series of valerianates, "cardole," an oily substance obtained from the pericarp of the cashew nat, said to be a powerful vesicating agest; bromoform, iodoform, metallic acid, pure tamin, and crystallized chronic acid, Henay Horwoop, of Richmond, Sarrey (190, p. 197), gallic acid. exhibited beautifully-pure sugar of milk crystallized under different circumstances. The crystals formed at 160° Fahr., in the dark, were particularly fine,

Hurstmann, of Horst, near Steele (Zol. t. 462, p. 1107), exhibited exceedingly beautiful samples of smalts Howards and Keyr, of Stratfurd (11, p. 187), had the Prize Medal accorded to them. Besides a highly-instructive and complete collection of the cinchona barks, which exeited great interest omong scientific visitors, salts of the vegetable alkaloids were exhibited by this house, with camphor in every stage of preparation; Borneo camphor, borns, and borneic acid, tartaric acid, citric acid, and their salts: various preparations of mercury of great purity, with salts of antimony, silver, zinc, and iron. series of benutifully-crystallized salts of potass, soda, and magnesia, completed this magnificent collection.

C. HUMPREY (78, p. 196) exhibited column produced by the combination of fatty acids with metallic oxides. J. Husnand, of Philadelphia (U. S. 49, p. 1435), exhibited his calcined magnesia,

J. W. and H. HUNKIBSON (86, p. 196) were awarded the Prize Medal for a beautiful collection of the principal salts used in pharmacy, manufactured by them. It included Rochelle salt, carbonate, hicarbonate, and phosphate of soda; nitrate and bicarbonate of potash; iodisle of potassium, of which some very fine erystals were exhibited,—with the iodides of lead and mercury, and tartaric and citric acids.

C. Jägen, of Barmen (469, p. 1078) exhibited no excellent specimen of safflower-carmine, II. C. Jenkins (99, p. 197) exhibited starch, gums, nod vegetable wax from the potato,

WILLIAM HARRY JENKINS (43, p. 192) exhibited arsenical powders intended to protect wood, &c.

F. Joner, of Würtemhurg (4, p. 1114), one of the first great manufacturers of quinine, obtained the Prize Medal for a case of that substance, which he exhibited. It was Mr. Jobst who established the identity of theioe and

enffeine J. R. Johnson (60, p. 194) obtained Honourshle Men-tion for his extract of "munject," This is a substitute for unsider, furnished by the roots of another plant, Rubia

William Joseph Kane, of Dublin (53, p. 193), exhibited salt-cake (salphate of sodn), made in brick furnees. with complete condensation of the muriatic seid, in a concentrated state; also blenching powder, made from the mariatic acid so obtained. The assugancese used by Mr. Kane is found in the Glaudure Mines, Curk, and contains 90 per cent, of the pure binoxide,

THOMAS KEATING (102, p. 197) exhibited the flowers of the Brayera anthelmistica, from Abyssinia (a celebrated remedy for tane-worm), also Matico, a new astringent and styptic, and other pharmaceutical substances, which obtained Honourable Mention,

JAMES HENKY KENT, of Stanton, near Bury St. Ed-munds (90, p. 196-97), obtained the Prize Medal for his dried pharmaceutical placts. This is a beautiful collec-tion: the dried flowers of colchicum, digitalis, and malva, retain the hrilliant hues of the fresh flowers; the powder of conium is of a beautiful green colour.

Jone King, Hurlet and Campsie Alum Compar

Glasgow (13, p. 188-89), was awarded the Prize Medal for his alum and prussiates of potash. All the salts were remarkable for their beauty and purity. The crystals of the red prussiate were not coloured dark and rendered impure by any admixture of insoluble cyanide of iron, and were perhaps the finest in the English Department, The alum was prepared from the alam-shale of the Scotch coal-field by the old process.

WILLIAM WAUDBY KING (84, p. 196) exhibited his effervescent eitrate of magnesia. KINZELORRGER and Co., of Prague (27, p. 1008), obtained Honourable Mention for a complete collection of

the colours used by painters.

KRIMMELBERN and BREDT, of Barmen, Prussia (457, p. 1076), exhibited a good series of chemical products and

colours for dyers and calico-printers; among which was included red prussiate of potash, A curious circumstance has been stated respecting the prussiates, namely, that red prussiate is sent from Germany to Eagland, while the clluw prussinte is imported ioto Germany from England to considerable quantity.

KURLMANN, BROTHERS, ebemical manufacturers, of Lille (555, p. 1205), obtained the Prize Medal for an interesting assortment of salts of the alkalis and earths.

io which, besides the usual articles of great consumption in a pure form, was included caustic buryts, which is prepared at a singularly low cost from the nitrate,—the nitrous fames being economised to the sulphurie acid chamber. The haryta is employed to precipitate sugar from the julee of the beet-root, to Dubroufaul's new pro-cess of purification. Also, artificial carbonate of baryta, prepared from the sulphate, which is first converted into sulphide of barium, and then exposed io a damp state to the action of carbonic acid gas, obtained by the combus-tion of coke. Professor F. Kuhlmann has discovered that the hydrosulpharic acid, set free in the operation referred to, can be economically converted into sulphuric acid, by transmitting a mixture of that gas and air in anfficient quantity through nitric acid. Among the less osual products are sulphite of soda and sulphite of lime, obtained by exposing crystallized carbonate of sola, or hydrate of lime, to the funes of burning sulphur. A liquid ammoniacal mixture for mannre was also exhibited, which is produced by coadactiog the non-coodensable gases from the leaden chamber through channels kept moist by the ammoniacal liquor of gas-works or by

Dr. L. Kunnaut, of Berlin (13, p. 1048), was awarded the Prize Medal for an elegant collection of chemical products, ehietly of the class used in dyeing, such as crystals of sugar of lead, uitrate of lead, acetate of lime, ataunate of soda, cyanide of potassium, oxide of uranium and tungstic acid in large quantity. The latter substance is exhibited by several manufacturers, probably with the view of having it tried as a substitute for peroxide of tia,

in some dyeing processes, C. A. Kustz, of Cornbrook Works, Manchester (9, p. 187), had the Prize Medal accorded to him for new colouring matters and preparations for printing and dyeing

cotton, linen, silk, and wool KUTZER med LEMBER, of Prague (24, p. 1008), obtained Honourable Mention for the ultramarine which they exhibited. They also presented chrome-orange and chromeyellow of fair quality.

COUNT F. DE LABDEREL of Tuscany (35, 1294), obtained the Council Medal for bis bighly-naccessful manufacture of boracie acid

HENRY LAMPLOVON (71, p. 195) exhibited a variety of harmscentical preparations, together with residual salts from the destructive distillation of animal substances. WILLIAM LAWRENCE (56, p. 193) exhibited specimens of cod-liver oil manufactured by him.

ALFRED LEA (105, p. 198) exhibited "myrrhine," a preparation for medical use, F. M. C. Leat, of Portugal (p. 1308), exhibited a collection of metallic salts (63, 67, &c.), resuarkable for

its number and variety. Other exhibitors, of the same country, sent crude and purified cream of tartar-an imortant article of commerce in wine-growing countries

ike Portugal. CHARLES LEE (69, p. 195) exhibited a new black dyeing material for dyeing silk, imported by him.
THE LEEBEN CHEMICAL MANUFACTORY, BEAT Drontheim (39, p. 1352), exhibited a well-crystallized sample

of bichromate of potash, a salt which is produced there of excellent quality, T. LEFERVER and Co., of Moulins-Lille (580, p. 1205), were nwarded the Prize Medal for their somerior white

- LEFEVRE, sen., of Nantes sur-la-Fosse, Loire Iuféricure (381, p. 1205), exhibited oxide of sine of superior quality, for which he received Honouruhle Mention. T. LEFFCHILD, of Upper Clapton (67, p. 194), exhibited specimens of dyes for silk, manufactured by him.

- Lenova, Vitry le François, Marne (308, p. 1191), the discoverer of "solicine," had the Prize Medal accorded to him in acknowledgment of the value of that discovery. A large quantity of the substance, very white and finely crystallized, was exhibited, with a specimen of the willow bark from which it is derived.

C. LEVERKUS, of Wermels-Kirchen, Prussia (875, p. 1097), stood high as an exhibitor of ultramarine, and had the Prize Medal awarded to him for that substance. G. LINBSAY, of Sunderland (16, p. 189), obtained Honourable Mention for sulphate of iron, of superior quality, manufactured from the iron pyrites of coal mines, exposed to air and moisture, the excess of acid being saturated by digesting the lixivium upon waste Copperas, so mannfactured, is sought for hy dyers. it is said, oo account of its rapid oxidability in the atmosphere.

J. LINKLATER (82, p. 196) exhibited cod-liver oil. THE LONDON DRUGGISTS (117, p. 199) contributed a large, systematic, and highly-instructive collection of

drugs, which received the approbation of the Jury.
WILLIAN LONGMAID (Class I., 441, 162) illustrated his new soda-process, for which the Conneil Medal was awarded, by specimens of the rock-salt from Cheshire, and cupreous pyrites from Cornwall, employed by him; and copreous pyrites from cornwas, composed by much the salt and ore mixed and ground; sulphnite-ash, the calcined product of the former, containing sulphnite of soda, chlorides of silver and copper, oxides of tin and iron, &c.; black ash, crude alkali, and carbonate of soda, prepared from the sulphate of soda; sulphate of copper, obtained by oxidising precipitated copper, and treating it with sulphuric acid; bleaching powder, the chlorine of which was obtained by passing a current of dried air through a close furnace, heated externally, in which the ore and salt are in process of calcination,

MORITZ LUCAS, of Cunersdorf, near Hirschberg (8,

1, Zol., p. 1048', obtained Honourable Mention for his cinnabar, of which fine and deep-colnured specimens were exhibit-d

CHARLES McCullocit (96, p. 197) exhibited an interesting collection of Euglish and American dried herbs

aud roots J. F. MACTARLAN and Co., of Edinburgh (107, p. 198), obtained the Prize Medal. They exhibited a series of preparations, on a large scale, illustrative of the manufacture of the salts of morphine, galfic and tannic acids sulphate of beberine, from green-heart bark; all excel-

lent specimer Mame and Co., of Strasburg (317, p. 1192), obtained Honourable Mention for their viuegar and other acetous products. They were, also, exhibitors of white lead, of good quality, and of purified alcohol from potatoes.

Dr. L. C. Manguanner, of Bonn (327, p. 1069), exhi-

bited several remarkably pure chemical products, in-cluding chloroform, cyanide of potassium, bisulphide of carboo, and concentrated acetic acid, for which Honourable Mentioo was accorded. Mrs. B. Mason (77, p. 195) exhibited Pooloo's Chinese

Changes Mason and Son (22, p. 190) exhibited speci-mens of blacking, of French and waterproof varnishes,

manufactured by them JOHN MARSHALL, of Leeds (68, p. 194, 195), obtained Honourable Mention for his arcbil, and various other pre-

parations from the lichens, and for lac-dyes MATHES and Wenern, of Duisburg, in Prussia (464, p. 1077), were awarded the Prize Medal for chemical products, chiefly intended for the use of bleachers and paper-manufacturers, of which fine samples were exhibited, namely, hydrochlorie acid, chloride of lime, Sulphite, and other salts of soda, including caustic soda.

MAY and BAKER, of Battersea (14, p. 189), had the Prize Medal accorded to them for their acids, salts, me tallie and other preparations used in pharmacy, all of

which appeared to be of excellent quality. Their refined camphor was beautifully transparent, Chanles Medssonnies, of Paris (916, p. 1224), had the Prize Medal pwarded to him for chemical products of superior quality, including extracts and solutions for

dyeing wool io a single operation. MELINCHYTHAN CHEMICAL COMPANY, of North, South Wales (2, p. 185), illustrated their mannfacture of acetate of lead by a spleudid exhibition of the crystallization of that substance, which obtained Honourable

Mention. MENICO and Co., of Paris (925, p. 1224), exhibited carefully-prepared pharmaceutical extracts, obtained by steam, and a variety of medicinal substances, reduced to impulpable powder, for which the Prize Medal was

ALFRED Microsa, of Puteux, near Paris (640, p. 1208), exhibited the extracts of various dye-woods of superior quality, for which the Prize Medal was awarded

T. Miller (1, Class XXX., p. 820) exhibited a complete assortment of artists' colours and materials, which received Honourable Mention. W. MODERLEY, of the Mulgrave Alum Works, new

Whitby (17, p. 189), was awarded the Prize Medal for his alum, prepared from the alum-state of that district, and sulphate of magnesia, extracted from the residual liquors of that manufacture.

A. Monkau, of Paris (325, p. 1192), exhibited products of distilled hitnmen, for which the Prize Medal was awarded.

Monoon and Son (106, p. 198) exhibited a beautiful collection, for which the Prize Medal was accurded, consisting chiefly of the rarer organic componeds; finelycrystallized salts of morphine, strychnine, ciuchonine, and pure aconitine; also veratrie, gallie, tannie, hippurie, salicilie, meconic, pyrogallie, and pyromeconic acids; croosote, the furfurol of Formes, furfuranide, nitrate of furfurine, chloride of uickel, &c.

C. Morter, of Paris (932, p. 1224), exhibited superior archid prepared for the use of dyers and calico-printers. Sir James Memar, M.D., of Dublin (87, p. 196), exhibited various fluid and solid preparatious of magnesia.

Professor C. Mussini, of Florence (37, p. 1294), obtained Hosourable Mention for colonrs, mixed with a peculiar preparation, which prevents the action of the san and the effects of moisture. The colours are used for

eneaustic painting and painting is fresco.
WILLIAM NAYLOB (35, p. 191) exhibited various varnishes of copal, sandarach, and mastic, and also specimens of deal wood stained in imitation of different woods, without the usual sizing

NISSEN, HILLARY, and PARRER (36, p. 191), exhibited tinted paper, chemically prepared in the pulp, for printcheques upon. W. G. Nixey (112, p. 199) exhibited a specimen of

K. Ormers, of the Grand Duchy of Hesse (8, p. 1126), received Honourable Meution for his products of gas-tar, obtained by fractional distillation. The term "ercosote," ontained by Inctional distinuion. The term "ereosote," is applied rather indefinitely, in Germany, to substances which may have an equal medicinal value, but differ considerably in properties. The crystallized ercosote of this collection is hydrate of phenyl. The colourless oil np-

pears from its odour to be chiefly benzole, CHARLES OWEN, of Edinburgh (83, p. 196), exhibited specimens of pure cod-liver oil.

ROBERT OXLAND, of Plymouth (225 and 485, Class I p. 143, 172), exhibited a variety of products derived from the distillation of peat in cast-iron retorts, which received Honourable Mention. The process inveoted by Mr. Oxland for the separation of tungstic acid from the ores of tin, by the action of sulphide of sodium and formation of soluble tungstate of soda, in a reverberatory furnace, also received the commendation of the Jury Specimens of sugar were likewise exhibited, refined by means of acetate of alumina,

S. OYLER (113, p. 199) obtained Honourable Menti for excellent lint for surgical purposes, which he exhibited

W. Pannott (46, p. 192) exhibited illustrations, in oil and water colour, of a new brown, derived from the smnt of corn, discovered by him, and recommended from

his experience of it as an artist, WILLIAM WATSON PATTINSON, of Gateshead, New-castle-upon-Type (18, p. 189), in partnership with a Juror of this Class, exhibited large masses of crystallized alum, masses of the simple sulphute of alumina, known in commerce as "concentrated alum," with a specimen of bicarbonate of soda, prepared by exposing

manufactured at the Felling Chemical Works. OTTO PAULI, of Carlsrube (328, Zol. 1, p. 1069), had the Prize Medal awarded to him for his phosphorus and other chemical products. The substances exhibited were chiefly derived from bones and animal matters, and included sal-ammoniac and the ferrocyanide of potassium, beautifully crystallized. The last salt was remarkable for its pale sulphur colour, an indication of value, as it arises from the entire absence of the red salt, which, in some dyeing processes, makes the colour appear dull by forming the green cyanide of iron. The annual produc-tion of prassiate of potash, in this old and increasing establishment, is about 80 tons; of sal-aromoniac about 20 tons; and of phosphorus 80 ewt. G. PEACOCK, of Southampton Docks (73, p. 195), ex-

hibited wood, preserved by a chemical process peculiar to himself. PELLEGRINI SNETHER, of Rome (3, p. 1285), exhibited

the native alum of the Roman States, purified by crystallization, showing that this ancient manufacture still maintains its ground, in competition with the enormous production of the same salt by the artificial processes, Moses Hain Picctorro (33, p. 190, 191) obtained Honourable Mention for specimens of guar-arabic, decolorized and purified by means of sulphurous acid,

PINTO, PEREZ, and Co. (121, p. 199), exhibited very fine acetate of lead, which received Hononrable Mention. THOMAS CARRY PONTING (25, p. 190) exhibited a mark-

ing iak.

PONTIFEX and Wood (1, p. 185) obtained the Prize Medal for specimens of various colours and pigments employed by artists and paper-steiners, and for other

chemical products. The crystallization of their tarturio and citric acids was truly magnificent, and also their snlphate of copper. They likewise exhibited a series of salphate of copper. interesting chemical and metallurgical products, illustrating the different processes of separating lead from its

Poorman and Viscon, of Schiedam, in Holland (2, p. 1142), one of the oldest houses in the white lend trade, p. 1142), one of the oldest houses in the white lend trade, obtained Honourable Mention for the superior quality of the samples of that salestance which they exhibited.
M. Poutsy (108, p. 198) received Honourable Mention for the new drag, "Indian hael," the fruit of the Bengal quince, which he has introduced; and for other pharmaches.

Powers and Wightman, of Philadelphia, United States

(262, p. 1452), had the Prize Medal accorded to them for a large and valuable collection of chemical substances; among which appeared piperin, narcotine, mor-phine, the valctionate of morphine, and a large quantity of a substance said to be menispermine

A. Prayand F. Agard, Aix (Bouches dn Rhône) (1682, 1257), exhibited (in illustration of the process of M. the Council Medal was awarded) specimens of the various salts contained in sea-water; chloride of sodium in large crystals, obtained from spontaneous evaporation; and the same in a granulated condition, for table use, by

dissolving in a hot solution of chloride of magnesium, and cooling.

The Rev. J. B. Reade, of Stone Vicarage, Aylesbury (3a, p. 185), exhibited evaniodide of iron, a new variety of soluble Prussian blue, and pure iodide of potassium. In the composition of the former substance, indine is sopposed to play the part of oxygen or cyanogen.

REEVES and Sons (7, Class XXX., p. 821) exhibited

various water-colours, prepared with wax, and other pig-ments, which received Honourable Mention. RICHARDSON BROTHERS and Co. (19, p. 189) exhibited

specimens of refined saltpetre, or nitrate of potash, obtained chiefly from the East Indies. The Bengal nitre, so refined, is a remarkably pure potass-salt. Professor Michell Ribolet, of Lucea (36, p. 1294), had the Prize Medal accorded to him for his improve-

ments in the colours for encaustic painting; which were accompanied by paintings executed by him to show the effects of the coloors. E. RILEY (125, p. 199) exhibited hippuric acid, pre-

pured in large quantity W. Rongarson, of Banff (81, p. 196), exhibited cod-

liver oil, said to be extracted by steam-beat, and rendered almost colouriess without the use of charcoal, or any other decolorizing agent; also skate-liver oil, manufactured in the same manner, which is preferred by some to cod-liver oil for medicinal use.

ROBERTSON and Co. (6, Class XXX., p. 821) exhibited various colours for artists, which received Houourable

J. Rockas (240, Class I., p. 143) exhibited various products of peat, which received Honourable Mention. F. Konn, of Wiesbaden, Nassan (7, p. 1132), was an exhibitor of ultragarine, distinguished by a Prize Medal. - ROCHAZ, of Mülheimon Ruhr (1 Zoll. 452, p. 1076) exhibited white oxide of zine of good colour, produced

directly from German calamine.
C. P. H. Rosseler, of Paris (1452, p. 1245), exhibited a chemical preparation for restoring gold and silver em-broideries, with illustrations; which received Honourable Mention.

Rowner and Co. (3, Class XXX., p. 829) exhibited the pigments used in oil and water-colour painting, with several new colours, which received Honourable Mention, THE ROYAL SAKON CHINA MANUFACTORY, at Meissen p. 1112), first prepared ultramarine in Germany; and

as exhibited samples of remarkable benoty, for which a Prize Medal has been awarded. THE ROYAL SAXON SMALT WORKS, at Schneeberg p. 1105), contributed specimens of their well-knowo pro-

RUSSELL and ROBERTSON, Holytown, Lanarkshire (59,

p. 193), exhibited specimens of white lend, said to be pro-

duced by a new and rapid lumid process; yellow chromate, and red dichromate of lead, for which they received

Honourable Mention. M. Salter, of Sardinia (10, p. 1302), obtained Hou able Mention for his pharmaceutical collection, which included a series of steuropteus, well crystallized from

oil of peppermiut and other essential oils - Sanin, of the Government of Kaluga, Russia (2) p. 1367), received a Prize Medal for salts of lead of good

quality, which he contributed, together with a small collection of other chemical products. Amerosio Saanto, of Matanzas, Cuba, Spain (242, p.

1344), exhibited an interesting collection of pharmaces W. Sattler, of Schweinfurt, Bavaria (14, p. 1099) received Honourable Mention for a rich assortment of

lac colours and nther pigments.

J. SETZER, of Weiteneggk, on the Dannise (23, p. 1008), represented the manufacture of nitramarine in Austria. He also exhibited the yellow sulphide of cadmium of great purity and intensity; with a collection of madder colours. An Honourable Mention has been

Savony and Moore (115, p. 199) exhibited kosso, imported from Aden, also sendul, or musk-root, supposed to be the produce of an umbelliferous plant of Central Asia, the introduction of which into pharmacy in this country is due to the exhibitors.

C. SCHLIPPE, of Moscow, Russia (27, p. 1367), had the Prize Medal accorded to him for superior prussiate of potash and alum. This exhibitor is known in science as the discoverer of the crystallized sulphostibite of as dim (NaS , SbS_s), and manufactures on a large scale. His chemical products are much esteemed in Russia. Besides those mentioned, the collection contained salts

of tin; oxalic, tartaric, and acetic acids. SCHILLING and SUTTON, of Brighton (52, p. 193), exhibited samples of the soda, Seltzer, and Fachingen

waters manufactured by them. STRUVE and Co., of Brighton (52A, p. 193), exhibited specimens of the artificial mineral waters which they have long manufactured with so much accuracy, namely waters of similar composition to the springs at Spa, Pyrmont, Marienhad, Kissingen, Seltzer, Fachingen, Püllna, and Vichy. These factitious chalybeates are said to contain carbonate of iron in solution, whereas in those imported a part or the whole is precipitated SCHECK and URLICH, of Bamberg, in Havaria (15, 1099), received Honourable Mention for ultramarine

of superior quality. SCHER and KOHRING, of Brandenberg, contributed pure tartarie acid, well crystallized, and also in fine

L. Scorr (61, p. 194) had the Prize Medal accorded to him for white oxide of zinc, manufactured as a substitute for white lead.

H. Sigole, of Stuttgard (6, p. 1114), was awarded the Prize Medal for an assortment of rich and pure red lakes. Schorsts Brownens, of Turin and Brozzo (1vrée) (4, , 1302), sustained the chemical reputation of Sardinia by the exhibition of a collection of salts, sulphur, saltpetre, and acids. They also exhibited fine samples of

phosphorus. SERZEDELLO and Co., of Portugal (17, 38, &c., p. 1308), exhibited a full series of well-prepared salts, and other chemical products.

A. SCHARENBERG, of Neustrelitz, Mecklenburg Strelitz (3, p. 1134), exhibited a fine assortment of madder-lakes, prepared by a new process, which it is said resist the action of light; for which a Prize Medal was awarded. p. 187) exhibited different E. SCHNERSARL (9, varieties of ultramarine of fine quality, for which a Prize Medal was awarded to him.

T. and H. Sattra, of Edinburgh (94, p. 197), had the Prize Medal accorded to them for aloin, the enthartic principle of aloes, first prepared by them; and for can-tharidin, of which a large quantity was exhibited in crystals.

- Sourt, of Grenelle, near Paris (1020, p. 1227), phtained the Prize Medal for his various qualities of oxide

of zinc. M. Sorel has contributed most materially to the rapid advance which the oxide of zine has lately made in France and clsewhere, as a substitute for white-lead.

Mesors, Spence and Dixon, of Peudleton Afum Works, near Manchester (7, pp. 185, 186), received Houourable Meution for their alum, prepared from gray schist by the action of sulphurie acid and the addition of sulphure of ammonia. Sulphate of iron, prepared by combining sulphuric acid directly with the residuary oxide of iron of burnt pyrites, was also exhibited; together with a hyourn't pyrites, was and extinities; together with a ny-draulic centent prepared from the refuse gas-line, united with the refuse of the shale, after the alumina has been extracted; and the refuse of Wicklow pyrites, after in use in the manufacture of sulphuric acid -from this latter substance the morrar obtains oxide of iron. The metallic salts present are said to prevent the growth of

oss upon the surface of this cement JOHN ALEXANDER SPENCER (31, p. 190) had the Prize Medal accorded to him for the various products of his chemical manufactory, including naphthaline, sulphate of magnesia, benzoic acid, hydriodate of quinine, and samples of cod-liver oil, which have kept their colour well for one

or two years. T. Spungts, of Saffron Walden (38, p. 191), exhibited the roots, stems, flowers, and stigmata of saffre

Peters Square (93, p. 197) was awarded the Prize Medal for a variety of pharmaceutical extracts and pre-served juices of medicinal plants prepared with great care; and for other chemical products.

HENRY STEVENS (74, p. 195) exhibited samples of deal stained in an ornamental manner, by colours manufactured hy himself. J. C. STEVENSON, of the Jarrow Chemical Works,

South Shields (122, p. 199), illustrated the crystallization of curbonate of soda by a magnificent specimen of that salt, which was received too late to be placed nmone the articles referred to the Jury.

WILLIAM STRUKKSON, of the Jarrow Chemical Works

(20, p. 189), received Honourable Mention for bicarbonate of soda, prepared by exposing crystals of soda to carbonie acid gas

STORMANN and WUSTENFELD, of the Chemical Manu factory of Neusalzwerk (460, p. 1077), had the Prize Medal accorded to them. They operate chiefly upon the mother-liquor of salt springs, as at the older establish-ment of Shünesbeck. The great variety of substances produced in Germany at the same works may be judged of by the following enumeration of the articles exhibited by this house, with their respective prices. The thaler may be taken at 2s. 10d., and contains 30 sgrs.; the sgr. will be equal to 1'33 of a penny :-

Pure sulphate of ziue, per lh., 3½ sgr. Acetic acid (1949 and 1969), phosphoric acid, chloroforu, respec-tively 26 sgr., 1 thaler 13½ sgr., and 1 thaler 25 sgr., per lb. Nitrie, sulphurie, parified hydrochloric acid (1900), rec 100 lbs. (1:120); per 100 lbs., respectively 10, 124, and 5 thaters. Carbonate of soda (99°95, and 99 per cent. pure carbonate); per 100 lbs., 7, 64, and 6 thaters 5 sgr. Ditto crystallized, pure crystallized, and sesquicarbonate of soda; per 100 lbs., respectively 2 thalers 25 sgr., 10 thalers, and 8 thalers. Sulphate of soda; per 100 lbs., 13 thaler and 2 thalers. Ditto purified; per 100 lbs., 4 thalers 1 sgr. Hyposulphite of sods, per lb., 8 sgr. Nitrate of sods; per 100 lbs., 11 thalers. Seignette salt, Attrate of sona; per 100 lns, 11 timers. Segrette sair, per lb., 7½ sgr. Acetate of potash, per 100 lbs., 14 thalers, 12½ sgr. Carbonate of potash, per 100 lbs., 14 thalers and 30 thaters. Ditto parlied, per lb., 1 thaler. Prussiate of potash, per lh., 20 sgr. Sulphate of potash, per 100 lbs., 9½ ballers; cysnalized, 40 thalers. Cyanide of potassium, prepared according to the process suggested by Lichig, per lb., 1 thaler 10 sgr. Soda-salt, of the salt water of Rehme, per 100 lbs., 3 thalers; mother-lye, of the same, 180 quarts, 5 thulers. Bleaching powd 100 lbs., 6 thilers. Sulphate of soda; per 1,000 lbs., 2 thilers 5 sgr.

STRATINGH and Co., of Gröningen, Holland (3, p. 1142), old makers of white-lead by the Dutch method, obtained Honourable Mention for the superior quality of their

J. and E. Stuage, of Birmingham (119, p. 199), ex-

hibited the red or amorphons phosphorus of Schrötter, manufactured by them; for which the Prize Medal was a warded.

JOSEPH STURGES, of Kettering (88, p. 195), exhibited a preparation for preserving the turnip plant from the ravages of the fly (Haltieu zemoram). M. B. TENNANY, of Brighton (101, p. 197), exhibited

a species of varnish of a silvery hne, for labels or artists' designs.

Tennant, Claw, and Co., of Manchester (Ta., p. 186). exhibited a good eellection of calico-printers ante; in-cluding sulphate of copper, sulphate of time, chloride of time, chloride of time, chloride of potab, yellow and red prinsiates of potab, inclinate of potab, paralleris, statunate of soda, soda-ash, histophate of soda, sal-ash, manchester, etc., and pink salt, for which they received lloouncable Meution.

J. TRIX, of Exeter (125, p. 199), exhibited extract of heabane, prepared from the wild herb. TRUMAN, HANBURY, BUXTON, and Co. (91, p. 197),

illustrated ale and porter brewing by specimens of the materials employed, and of the products obtained. A. T. TYLLACH, of the Royal Guspowder Mills, Waltham Albey (21, p. 189), obtained Hooourable Moution for the magnificent and extremely remarkable

J. Testrax, of Melcombe, near Banhary (97, p. 197), exhibited petals of the red rose, confection of the red

exhibited petals of the rea rose, contessor, rose, and extract of heabase, prepared by him. Torrax and Usura, of Melcombe, near Banbury (98, p. 197), exhibited English rhabarb grown by them. The Banbury rhubarb is the produce of the Rheam rhapos-

ticsm.

The Vielle Montagne Zinc Mining Company, of Liége, Belgium (26, p. 1152), obtained the Prize Medal for fine white oxide of zine.

for fine white oxide of zine.

WAGENBARN, SEYORL, and Co., of Vieuna (19, p. 1007, 1008), had the Prize Medal awarded to them for a fine collection of salts ehielly used in pharmacy.

O. W. WALDTHAUSEN, of Clarenburg, near Cologne (320, p. 1069), manufacturer of white lead, contributed superior specimens of that article. Dr. N. WALLICH, of London (no. 884, 885), head the

superior specifiers of time article.

Dr. N. Wallicti, of London (pp. 884, 885), had the Prize Medal awarded to him for his great collection of Indian woods, which included specimens of the trees furnishing dye-stuffs, resins, oils, and different medicinal substances.

John Ward, of Ramelton, County Douggal (89, p. 196), was awarded the Prize Medal for the usual products from

kelp, including iodine, chloride of potassum, sulphate of potash, and alkali-salt, all of superior quality. WARD, SMITH, and Co., of Glasgow (54, p. 193), exhibited iodine of good quality, with the salts of kelp,

hibited iodine of good quality, with the salts of kelp, which they manufacture. William Warr, of Daochattan Chemical Works, Glasgow (32, p. 190), obtained the Prize Medal for iodine and salts of kelp, viz.; sulphate of potash, chloride of potassium, and erude earl-counter of soda.

Jours Warrs (103, p. 198) obtained the Prize Medal for various chemical and pharmacericial rubbatnees manufactured by him, ineluding an interesting collection of extracts propagate in open vossels at a temperature of from 110 to 193° Falar. The collection endbraced, the send extract of coldesium, from the fresh cornus; executed to a construction of the control of the collection of the co

quoriee, from the fresh root; extract of Turkey rhanh, from the dried root; extract of fetial goose-foot, from the flowering plant; extract of hemlock, from the drowering plant; extract of hemlock, from the meanty ripe; inspisanted ox-gall; extract of hemlone, from the throwing plant; extract of white popples, the fresh ox-gall; extract of white popples, the fresh ox-gall; extract of dandelion, from the fresh ox-gall; extract of white popples, the fresh oxide of the fresh oxide of the fresh oxide of the fresh oxide o

G. D. Wenes, of Venice (18, p. 1007), exhibited samples of fine crystallized cream of tartur, for which he received Hononrable Mention.

Hononrable Mention.

J. H. WEINS, of Mühlhausen (684, p. 1088), exhibited an assortment of the firest madder lakes, for which the Prize Medal was awarded.

Prize Medal was awarded.

Wassexpetata and Co., of Barmen, Prassia (461, p. 1077),
had the Prize Medal accorded to them for a collection
of chemical salts, among which, the sulphide of soda,
med as an antichlore, was consolicous.

used as an antichtore, was conspections, Warmskrat, and Haorinza, of Philadelphia (43, p. 1435), exhibited a good collection, upon a considerable scale, of salts for pharmaceutical purposes, which was awarded Honourable Mention.

Thomariase Sentino A. W. Hessans and Ch., of Augustenhütte, near Boon (334, p. 1070), had the Prize Medal accorded to them for the products of distilled seishst. Their liquid products are suitable for illumination; they also obtain paraffin, in quantity, and make good black varnishes for conting iron, &c.

Joss Wilson and Son, of Hinter, near Glagow, (6, p. 185), were warded the Prize Medial for their along (m. 6, p. 185), were warded the Prize Medial for their along their of which magnificent specimens were exhibited, together with a rich series of shales, hair-vaile, and other liliatrations of the manufacture. Fine sulphate of iron, obtained to the manufacture. Fine sulphate of iron, obtained manufacture and their control of the control

Winson and Newron (28, p. 190) also had the Prize Medal accorded to them for artists' pigments, of which a most extensive collection was exhibited both to the raw and manufactured states.

Woarr and Co., of Selverinfurt (17, p. 1092), contributed to the display of altramarines, remarkable for their cheapness, for which Germany is distinguished. Woom and Burronn, of Leckel (47, p. 102), Mol Blooursale Mention seconded to them for their amounfactured products from lichens. The perparations used in dyrleng were accompanied by several pure chemical prioriples of the lichens, stansty, erythric acid, lecanorie and recellic

acids, pyeroerythrin and orein.

J. Youwo, of Ardwick Cheroical Works, Manchester (7, p. 187), ohtained the Prize Medal for his stammate of soda, prepared by the action of caustic soda, aided by heat,

SOME, PEPERTOR BY THE RELIEF OF THE BOOK OF THE PROPERTY OF THE PROPERTY OF THE PEPER OF THE PEP

J. Zenez and Co., of Rixheim, Hant Rhin (1836, p. 1836), had the Prize Media haarded to them for their nitramarioe, which is remarkable for its fine division and beautiful violet tint. They also supplied a greeo variety of ultramarine, and a collection of paints.

London, January 1852.

THOMAS GRAHAM, REPORTER.

CLASS III.

REPORT ON SUBSTANCES USED AS FOOD

The figures after the Names (between purentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATES CATALOGUE.

Jury.

EGWARO OF LORE, Chairman, Russin; Member of the Institute for the Administration of the Domnins

EOWARO ON LORE, CRAITERS, RESSER, SPERMET OF THE STREET OF THE STREET, SPERMET OF THE STREET, SPERMET, P.R.S., Proposity Continues, Society Copper Brooks, New pt. Bottanist, Coorrel Barwin et Remonater, France ; Secretary of the Central Juny, & Govern Linexie in Kennotate, France; Secretary of the Central Juny, & Govern Linexie in California (Secretary of the Central Juny, & Governity College, Annua, Eurori, Fairel Vester); Professor of Botsany, Eniversity College, Annua, Eurori, Fairel Vester; Pinnier, Secretary of the Central Juny, & Governity College, Annua, Eurori, Fairel Vester; Pinnier, Secretary (Secretary Continues).

In conducting their duties, the Jurors have adhered to the arrangement of materials proposed by the Royal Commissioners in the Classified Catalogue, with the following exceptions: -Opinm;

Fruits preserved in sugar; Starches used for manufacturing purposes;

Glue and gelatine; all of which have been included in other classes. The Jurors, in the choice of "Experts" (under In-structions, Art. 7, and General Decisions, Art. 29), have

been assisted by various eminent merchants, and other persons having the confidence of the public and of the Jury, and who were in no way connected as exhibitors, or otherwise, with the Exhibition. The "Fxperts" thus selecte

The "Fxperts" thus selected, in every instance, promptly placed their services at the disposal of the Jury; and by their zeal and alacrity, by the knowledge and ability they have displayed, the general manimity of their opinions, as among themselves, and with the Jury — they have rendered to the latter both a service and a kindness, great, in proportion to the responsibility of the duties in which all were engaged.

The divisions of the Sub-classes were considered searately by the Jury, and are separately reported upon Allusions have, here and there, been made to "the state of industry of each nation as shown in this Exhi-bition" (see General Instructions for Juries, Art. 5), Where the materials for any such nutices are insufficient, the deficiency is specified. The articles and exhibitors are arranged under—1. British; 2. Colonial; and 3. Foreign contributions; commencing with the Old World.
There were meetings of the Jurors beld on about 40

days, their duration averaging about five hours at each meeting, and on no occasion was a day lost from the abscuce of p quorum.

A. I.- COMMON EUROPEAN CEREALIA

Of the cerealia, commonly cultivated in Europe, viz., wheat, barley, oats, and rye, the Jurors have examined about 500 samples, many of great excellence. These are enhibited in various qualities, and with different objects; some are cars on spikes, for scientific illustration; some, mere specimens, in boxes or bottles, forming important portions of the series of vegetable products that various countries have contributed; and, lastly, there are sacks and barrels of different grain from England, the colonies, and exporting countries in general.

These are unequally distributed, and afford no general information as to the relations between the countries and their produce, nor much as to the importance of their cultivation in the various parts of the world exhibiting

Thus, of oats, rye, and barley, which are the staple crops of porthern and mountainous Europe and Asia, but very few samples are in the Eahibitien: comparatively speaking, wheat is very insufficiently represented from

the United States; better, from our cold and temperate colonies; indifferently from England, Scotland, and Ire-land; and hardly at all from the continent of Northern India, where it is a most important winter crop,

There are three collections which appear prominently interesting in this division, and require a particular notice; they are those of Messrs. Lawson, Mr. Maund, and Mr. HAYNBIED.

II. HAYNBED. Messrs, Lawson's collection (105, p. 206) enhibits the ear, grain, &c., &c., of every variety of cereal, and also models of all the roots which it has been found practicable. to cultivate in Scotland: the specimens are beautiful, and the arrangement scientific and excellent. No consideraproviding all that is necessary to render this collection a true and complete illustration of the vegetable products of

true and complete illustration of the vegethicle predicts of the large or for their adminish yieldplayed, very complete, instructive, and viex-afficially-arranged collection of the almostary products of Scollact, (24, p. 203) collection of hybrid cervalia are of great interest, from the importance of the process in other depart-ments of the vegetable kingdom, and the howen difficulty of hybridizing the eversion in protessies. This wises from of hybridizing the eversion in protessies. the pains required to entruct unexpanded anthers from one parent, and to replace them with the pollen of another reventing at the same time the stigmos to be fertilized from receiving any other pollen than that artificially ap-plied, and guarding them afterwards from the attacks of birds, and a variety of disturbing operations. The result appears, in most cases, to be an offspring stronger than appears, in most cases, to be an onspring stronger than either parent. Cone wheat has been principally experi-mented with by Mr. Maesh, and it coughts much glu-ten; but its extended culture has been discontinued by farmers, owing to a preference for wheats from which a whiter brend may be made. Mr. Mauxu's object is, by creating this cose wheat, to obtain an ornspring symmoty productive, but with more starch in the grain. A Prize Medal has been awarded for the series exhibited. Mr. II. HAYNING exhibits a similar series, for which a Prize Medal is also awarded. This gentleman eemmenced his experiments, in 1846, with two wheats of very opposite character, the "Hopeton," a white wheat of long ora and arws. and fire grain—and the "Jipper shibelex," a course crossing this cone wheat, to obtain an offspring equally strew, and fine grain—and the "Piper's thickset, a conre-red wheat, with thick clustered ear and stiff straw, very productive, but apt to mildew. A few shrivelled ears were first produced. These were planted, and the young plants divided. The produce was copious of all interme-diate varieties, some so very like their parents as to be rejected. Picked grains being selected, abradant crops of both white and red hybrids were produced, partnking

of both white and rea nyonas were prounces, passang of the best qualities of both parents.

There are no wheats exhibited superior to the South Australian. This is probably owing to elimate, for it appears, after a careful examination of many samples from the best wheat-growing elimates, that Spain and the best wheat-growing elimates, that Spain and the same produce hard wheats. certain districts of southern Russia produce hard wheats,

equalling the Australian; whilst the produce of England, of the south of France, of the United States and Canada, hardly fall short of the same high standard. Large allowances have, in many cases, to be made for faulty agriculture, careleoly collected or insufficient samples, and for inefficient methods of threshing, &c., the grain. Such circumstances affect the adjudication of awards, but not perhaps the original value of the erop from which the samples were collected, I. BRITISH DEPARTMENT, - R. WESR'S " Talay

wheat (72, p. 205) has been awarded a Prize Medal; it is a splendid specimen of English wheat, equalling in value any brought to the market.

H. PAYNE'S " Revitt" wheat (82, p. 205) has nloo a

Prize Medal; it possesses great value, and should wholly supersede the entivation of the Egyptian Revitt, which is far too abundant in the English market.

J. MacKillican, of Cawdor (Scotland), a Prize Medal

J. MACKILLACK, Of Lawdor (Scottane), a Price Mean for excellent white wheat (114, p. 200). I.R.H. PRINCE ALBERT exhibits samples of his farm produce (107, p. 200), consisting of "White Criddham" wheat, "Augusta beaust," and "Winter oats." The col-lection deserves a special gatile, each of the samples long of excellent quality. A Prize Modal has been awarded to II.R.H. for the oats and beans, the wheat appearing to the Jury to be a little deficient in colour and quality, whea compared with other market samples of the same description.

Amongst the other British samples there is little above mediocrity, except the following, of which Honourable Mention is made:

A. SHEPPARD, Ipswieh, for good wheat, malt, and barley (70, pp. 204, 205).
The Tatho Local Committee, for samples of various

cerealia (71, p. 205) enlitivated in Cornwall.
C. Ginson, Pittochry, Scotland (102, p. 206), for barley grown at an altitude of 600 feet.

J. SUTTON and SONS, for maked barley (112 p. 206), Mosas, H. E. and M., exhibit Australian wheat in this department, also deserving of Honourable Mention.

But few malts are exhibited; the samples shown by

But few maits are exhibited; the samples shown by TAYLOS and SON (77, p. 205) receive Housenrable Men-tion. A sample of porter malt prepared by a "patent process" was exhibited by S. R. Poou, C. 146, p. 193*), in which the "torrefaction or reasting" was not carried so far as in the ordinary hrown malts, and which is said to contain in consequence a larger proportion of unchanged steeharine matter.

2. Baitish East India.-Wheat (870) has from time mmemorial been a staple crop in the plains of northern India, and especially in the Punjauh; and since the establishment of the stude at Buxar, Ghazepore, &c., oats have been extensively cultivated. Both are winter (cold weather) crops. The climate and soil are well fitted for these ecreals, but owing to defects and carelessness in the agriculture and harvesting, the crops, though excellent, fall short of what most corn-growing countries produce. Further, owing to foul boats and granaries, and to the moist heat of the mouths immediately succeeding harvest, the wheat reaches England in a state too dirty and weavelled for market. There are two samples in the Exhihition, one of hard and one of soft wheat, of which the former is most prized by natives of India, probably for no better cause than that the hardness of the grain more elosely resembles their favourite food, rice. Barley is most extensively enlitivated in the Himalayn and Tibet. replacing in many districts the wheat, and producing an admirable flour; both are desiderata (as are the oats), which is much to be regretted.

3. Australianta. -- From this quarter of the globe, inelnding VAN DIENEN'S LAND and NEW ZEALAND, there are splendid samples of wheat, some of barley, and a few of onts Pont Abelaide stands pre-eminent for wheat and

borley. Prize Medals have been awarded both in R. HALLETT and Sons (South Australia, 5, p. 991), and to HEATH and Beasow (9, p. 999), for wheat, which may be

POUT ADELAIDE, though much that was apparently excellent from the former was spoiled during the vo From Van Diemen's Land fine white wheats are exhibited by Messes, DEANE, DEAN, and DEANE, and also by Messes, M'PILEASON and FRANCIS (350, p. 1000), to whom Prize Medals are awarded; the unit also of E. Toorn, Bagdad (47, p. 993), is considered worthy of Honourable Men-

NEW ZEALAND is represented by wheat, burley, and nalt, all of good character. The barley exhibited by HUGH MARTIN and by Thomas RESWICK, and the malt exhibited by Hoorga and Co. (39, p. 1002), severally receive Honourable Mention.

4. Canada sends a fine supply of wheats, all of the ordinary English kinds, but every sample of more than average excellence. One barrel of D. Christie's white wheat (35, p. 962), sent by the Agricultural Association has been awarded a Prize Medul, as has one of Polish onts (38, p. 962.), of adroirable quality, exhibited by R. M. Warrs. The barley is very good. All have the advantage of bearing their prices in the Canada market,

showing to what profit they may be exported.

Nova Scotta sends some good red wheat.

5. Cape of Good Hope. The soft white wheat exhihited by J. A. Ban (46, p 951) is of great excellence, and has been awarded a Prize Medal.

6. Jessey contributes a collection of specimen ears, of 104 varieties, &c., of wheats (2, p. 940), accompanied by remarks on the seasons, nature of the crops, &c. A Prize Medal has been awarded to Colonel LE COUTEUR, the exhibitor.

7. MALTA. - Honourable Mention is made of the white whent (4, p. 944) of G. Pulis, Montebello,

wheat (4, p. 944) of U., PCLIS, Montebetto, S. Batolivas. Although a large display of wheats (there being fully 70 samples exhibited, p. 1159), there are none of any striking superiority. The red wheats are, in general, superior to the white; some "froment blane d'hiver" is, however, good. Oats and rye are also

of fair quality. 9. FRANCE.—There is no bulk of corn exhibited in this department; and the few samples there are seem chiefly intended as illustrations of manufacturing processes, where gluten is the constituent desired.

A Prize Medal is awarded to Bazin's wheats in the ear, &c. (1073, p. 1229); an important collection of agrientural produce, containing a new variety of wheat,
Honourable Mention is also made of Magnix's hard wheat, of Auvergne, used in the manufacture of his pates and macaronis (1337, p. 1240); also of Mastar's English and Russian wheats (1334, p. 1240).

10. ALGERIA sends wheat of great promise, amongst which, one, that of LEPELLETIER (33, 1261), has been awarded a Prize Medal. It is a soft fine-coloured wheat

of much value 11. Spain.—The Spanish wheats, though generally dirty, are unusually fine in quality. Many bottles full are exhibited, but the samples contained are insufficient,

and almost universally mixed. and almost universally mixed.

To one particularly fine sample from the Mayor of Medlim del Campo (65, p. 1333), a Prize Medla has been awarded. It another bottle the Jury recognized the original stock of the Talavern wheat, probably of a very fine description, but not in a sufficiently satisfactory

state for a correct judgment to be pronounced upon it.

12. Portugal illustrates her agricultural resources by

80 bottles of cerealia, all of fair, but none of particular merit. Her colony of Madeira also sends a sample of wheat. 13, The Zollverein States, Austria, and Tescant,

nd scarcely any agricultural produce worthy of notice. 14, DENMARK. Barley is now very extensively exported by this country, and is of an excellent descrip-tion. A sack of good quality is exhibited by II, Puc-Land and Co. (1, p. 1355), and was found worthy of Hononrable Mention.

15. Russia. - The collection of Russian cerealia is the to the state of th

KOUCHELEFF (32, p. 1367) has sent the greatest variety, and a Prize Medal has been awarded to his collection in general, in which the black wheat and naked barley, &c., are worthy of particular notice and Honourable Men-tion. Hard white wheat, from Odessa (42, p.1367), exhihited by Colonel Shanklsky, has been awarded a Prize nited ny Colones Shanklaky, nan see'n awarded a Prize-Medial. This wheat yields a very large erop, and is never grown on manned land, which is considered pre-judicial to it. A flur sample of wheat (Armaon) from the Government of Saratoff, exhibited by — Bantza (39, p. 1857), has been awarded a Prize Melal. Black wheat (37, p. 1867), a very valuable cereal, cultivated chieft by the Conceder of the Aroff Sach Less consider chiefly by the Cossacks of the Azoff Sea: these samples are from the estates of Petroffskaja and Novo Spasskaja,

Onta from English seed, exhibitor M. Selivanory (52, 1368), a Prize Medal,

The following are considered worthy of particular notice and Honourable Mention: Hard wheat of Koubanka (60, p. 1368), Lieut.-General Easnorr; and of Arnaontka (35, 1367), M. KLEPATSKY; pearl barley, Baron Rope (47, p. 1368); oats, M. Oun-ROVSKY (54, p. 1368).

A polentum of half-ripe rye demands notice as a novelty to England, though extensively consumed in

16. TURKEY.-A large series of considerable merit illustrates the agriculture of this country. It is composed of samples of grain in bottles, too scanty for accurate examination; and many are dirty and carelessly collected. Nevertheless as a collection it is well worthy of attention. and one of the samples, a hard wheat (2149, p. 1386), has been awarded a Prize Medal.

nas been awaried a Prize Medial.

17. Euryr.—This country grows more millets than corn, but both are copiously illustrated. One sample of white wheat, exhibited by H. H. Amass Pasna (52, p. 1493), is of admirable quality; it is very large in the grain, and soft, and has been awarded a Prize Medal. The barley is good.

18. TONIS.—The cereals resemble those of Egypt in

kind. Good hard wheats are exhibited, considered of

musual excellence in that country. The skinless barley deserves notice. 19. UNITED STATES OF AMERICA. The ACRICUL-TUBAL SOCIETY Of NEW YORK receives a Prize Medal for a well-arranged and instructive series (83, p. 1438) of the wheat cora (in ear), generally cultivated in America. This is illustrated by remarks relating to the seasons, soils, and produce, and suggestive of various improvements in agriculture.

Among many barrels of fine wheats there is one of particular merit, to which a Prize Medal has been awarded; it is a soft white wheat from T. Bell, of Genessee (103, p. 1440), alightly injured by the voyage, but hardly in-ferior to any in the Exhibition. Among other cerealis of the same exhibitor, the red Mediterranean wheat deserves notice. Honourable Mention is made of the wheat exhibited by W. Horchers (342, p. 1456)

A. II.-CEREALIA BARELY CULTIVATED IN EUROPE. Ricc, maize, and the Croix luchryma (Joh's tears) are the chief products that appear to come noder this head-millets, &c., being placed in a separate sub-class. As an article of import, rice holds a very prominent place. Maize, on the other hand, has not found much favour in Great Britain, its flour, however cheaply imported, having never perhaps been sufficiently appreciated.

1. GREAT BRITAIN.—Rice requires more number heat

than this climate ever affords. Maize has been repeatedly experimented upon, and has been, up to the present experimented upon, and has been, up to the present time, the fruitful subject of speculation and discussion. Though occasionally successful, the crop is very nucer-tain, and always scanty. A fair sample is exhibited by tain, and always scanty. A fair sample is the Tauro Local Committee (71, p. 205).

2. Baltish East Indies.-Copions samples of about 50 Indian rices are exhibited by the Honouranue East Indian Company, and to them a Prize Medal is awarded. Many are of good quality, but more are dirty, small, broken in the grain, and unequal; characteristic of the slovenly state of the Indian bazaars. The quality of many appears only after beiling. In size, colour, and fineness of grain, none are at all comparable to the Caro-lina and Northern Italy rices; several are however very enrious, especially the monatain rices, grown without irrigation, at elevations of 3,000 to 6,000 feet on the Himmlayah, where the dampness of the summer mouths compensates for the want of artificial moisture. The small reddish Assamese rices which become gelatinous in boiling, and the large, Cat-grained, soft, purple-black "Ketnua" rice of Java and Malacca are also very curious. The East Indian maizes are inferior in quality, and deteriorated. Boaxao exhibits a large series of rices, some of them carions

3. West Indian Possessions,-Rice and maize are the staple crops here, but except from British Guiana,

the contributions are trifling.

4. Australiana. - Maize is exhibited from New ZEALAND, where it forms an indifferent crop; and from NORFOLK BLAND. 5. THE CAPE OF GOOD HOPE exhibits maize of fair quality

6. France.—The cultivation of rice in Europe is quite confined to the Southern States, and chiefly to the borders of the Mediterranean, where it is extensively grown, and is of good quality. Two varieties are exhibited from is of good quality. Bordenx, by A. Frav (305, p. 1203), to whom a Prize Medal is awarded. One is a heautiful, soft, brittle-bearded rice, irrigated, and called "Nostrana;" the other, unirrigated, is bearded, harder, greyer, and larger in the grain, and is called "Chinese rice," Algeria contributes rice and maize of indifferent quality.
7. Spain.—The sample of rice from Valencia (72,

p. 1333) is equally good with that of Bordeaux, and swells much in boiling; it has been awarded a Prize Medal. Some good maine in exhibited, as also a sample of the reeds of Cencleus picotas, a cereal little known in Northern Europe, and of no great value.

8. PORTULAL.—The Carolina rice of M. BELNONTEZ,

is of good quality, but hadly basked and bruised.

9. Sardenia.—The Ris de Pictoon (18, p. 1303), exhibited by Blonnel, Gaston, and Co., of the same kind and quality as the Bordeaux, has been awarded. a Prize Medal. 10. AUSTRIA contributes different varieties of maize,

11. RUSSIA. - Much rice, and of good quality, is cultivated in the southern provinces of this empire. Two samples are exhibited, one unirrigated, from the mountainous districts of the Caneasas; the other in the state of paddy (unbusked) from Odessa. Of the latter, one specimen called Chaltik, from Khalil Beck (57, p. 1308), exhibited by Zilfoogar Beck Isrander Beck Coll, is worthy of Hononrable Mention,

12. EGYPT.—Rice abundant, and of good quality; that cultivated in the Delta of the Nile, at Rosetta, is considered the best; the grain is broad, short, flat, and peculiarly striated.

13. UNITED STATES OF AMERICA.—The American rice, though originally imported from the old world, is now much the finest in quality. The Carolina sample of E. T. Hentor (172, p. 1448) is magnificent in size, colour, and cleanness, and has been awarded a Prize Medal. tiful sheaf of beardless rice is also exhibited. Maize is a more important crop in North America than in any other civilized country, being used most extensively for stock feeding; as flour for cooking; and in various forms at table-green, as well as ripe; toasted, boiled, or baked. The collections from Affaction are very fine, particularly that of B. B. Kirriand (84, p. 1438), who exhibits 34 varieties, amongst which are to be found samples of nearly all those usually cultivated in the United States, A Prize Medal has been awarded to him.

A. III.- MILLET AND OTHER SMALL GRAINS USED AS Poop. Under this head, besides millets, the Jnry have considered back-wheata: neither are well represented in the

Exhibition, though of great importance in many parts of the world. Buck-wheat belongs to the temperate and arctic climates, and is cultivated in Northern Europe, Asia, and America, and most abundantly in Central Asia and the Himalayah; in the latter country the different varieties are grown at various elevatious, between 4,000 and 12,000 feet. The finest samples exhibited are from Canada, by E. Taknnolme (52, p. 952); they are de-serving of especial notice, and Honourable Mention. The United States, Russia, and Belgium, also exhibit small

samples of good qualities. Millets, again, are tropical or sub-tropical crops: in India they hold a second rank to rice alone; and in Egypt, perhaps, surpass all other crops in important in West Africa they are the staff of life. The Egyptian erhaps, surpass all other crops in importance. samples are the finest, and those numbered 90, 91, and 92, p. 1409, exhibited by H.H. LLIAN PASRA, are deserving of Honourable Mention; they belong to Holour arghum and H. s seekaratum, and are known to Europeans

"petit mais. From INDIA various samples are shown of the different species of Panicum, but not labelled in the manner such

an instructive collection should be.

CEVLOX exhibits millet of fair quality.
The red and white millets of Australa, Russia, and the UNITED STATES are beautiful, particularly the Russian samples (60, p. 1368), exhibited by Lieut. Gen. Emmorr, of Panicum Italicum and miliaccum, to which a Prize Medal is awarded Tranex abounds in small grains, and exhibits a large variety of them; but the samples are insufficient and

A, IV.-PULSES AND CATTLE FOOD,

Under this head the Jury have included all leguminous seeds, whether cultivated as food for man or eartile. The importance of peas and beans is well appreciated. both by the horticulturists and agriculturists in Europe, and our temperate colonies, where, however, they are comparatively of less importance, than the smaller pulses comparatively of less importance, than the smaller pales-and grains are in various tropical countries,—such as haricots in the Braxils and West Indies,—ground or earth-ants in South America, and especially in Western Africa,—beans of various kinds amongest the miners of Pern,—grams (F various kinds amongest the miners of Pern,—grams (F various kinds amongest the miners of innumerable varieties of beans and small leatils, among the natives of India and Egypt,—and the Carob bean or St. John's brend (Ceratonia siliqua) in the Mediterranean countries. The above are all more or less copiously represented in the Exhibition by the countries named. In the British Department, Lawson's great collection stands pre-eminent for extent and scientific value; and

there is also a large one of agricultural produce from Mesers, Gibbs. II.R.H. Paixce Albert's "Augusta " are magnificent, and have been awarded a horse-beans," are magnificent, and have been awarded a Prize Medal as part of the collection of agricultural produce alluded to under A. I. W. P. Caocunton's golden pod beans (92, p. 1206) are worthy of Homarable Men-tion. RAYNBIRD's tick beaus and those of STRANCE are good; as are also FORTH AM's prolific peas.

ROOM, is a are any fool hit NY sproitte peas.

CANADA seconds peas, becaus, and haricots, all of excellent descriptions; and no less remarkable for quality and colour than for cheapses. The blue imperial peas sent by D. Joses (41, p. 962) would command the highest price in any English market; they have been awarded a sent peace of the peace

price in any cangino market; new party to the Lutwouts (40, p. 962), for his fine sample of white press.

BELUIEN, SPAIN, PORTYOAL, TENKY, TENKS, and EUVET exhibit, each, beans, peas, baricots, pulses, and a compared of the control legumes of all descriptions, but none except the Egyptian beans are worthy of especial notice.

Russia, besides many of these, exhibits green sugar-peas (dried unripe); those exhibited by Khoanor.corr and GREGORIEFF (63, p. 1368) are worthy of Honourable Mention for their excellent flavour and sweetness,

A. V.—GRASSES, FEDDER, PLANTS, AND ACRECULTURAL ROOTS.

Of these, including clover-seeds, &c., there are but few specimens beyond those in the collections of Mesars, LAWSQN and Mesars, Grans. The splendid specimen of

Messrs. Lawson, and in full flower, deserves especial

CANADA and the United States exhibit clover-seeds and timothy grass. Of these the timothy-grass seed (61, p. 93) of T. McGinn, Moutreal, and the clover-seed 62, p. 93) of G. Jeffries, are writhy of Honourable Of agricultural roots there are none worthy of mention,

except the Portuguese Cyperus esculentus of the Manquin DE LOULEE (401 n) be included, which is worthy of Hunourable Mention.

BELGIUM contributes hay of fair quality. hibits samples of clover-seed, and Tuxes of hay-seed.

A. VI.-FLOURS, AND PREPARATIONS OF THE ABOVE CLASSES,

Under this comprehensive head, the Jury have considered, not only flours properly so called, but various biscuits and semolines, os also pates, macaronis, vermicellis, and other manufactured articles referred to them, It is difficult, in many cases, in determine, satisfac-torily, which belong to this, and which to the starch series (F).

There are but few English wheat-flours exhibited; and the general remarks made under the head of "cerealia are equally applicable here; - except that the United States contributions of wheat-flours are really magnificent. Pea and bean flours, and sundry alimentary substances prepared therefrom, find a place here.

1. Gakat Baitain.—Amongst the various, but far

from extensive, series of flours from this country. Prize Medals have been awarded to-Kipp and Podger, Isleorgans have been awarded to—ADD and Podden, ble-worth Mills, for Australian wbeat-flowr (150, p. 193*). Edward Chitty, of Guildford, for flour of English white when (159, p. 193*). And to Bluck and So, for Brailford (162, p. 193*), for outweal-flour. Honourable Mention for particular excellence is also

made of the following:-W. JUSSIN, Shropshire (95, p. 206), for wheat-flour.
J. M'CANN, Drogheda (153, p. 193*), for outment.

J. M'CANN, Drogheda (133, p. 193*), for natureal. ASHLEY'S fours of peas, groats, and pearl harley, exhibited by T. Styllas (157, p. 193*), pot up for long voyages, are sound and useful preparations. Inferim macuronis of English manufacture are exhibited by W. LSYY (120, p. 207), and by J. P. GENTILE (108, p. 206), together with glutens and other allimentary substances. A very fine collection of gluten preparations, chiefly of scientific interest, is exhibited by Madane St. ETRENE (138, p. 208), who exhibits, also, some curious dried ali-(138, p. 208), who exhibits, also, some curious dired alimentary substances, composed partly of flour and partly of meat. HULLOCK's semioh appears to be wheat-fluor granulated with gluten. The riree glutten of Oblanto Jouns (128, p. 208) is obtained from rice-flour used for the manufacture af starch, dissolved by caustic soda, and then precipitated by an acid. RECET and SON, of Hull, exhibit various starches and sages (125, p. 208), all apparently derived from potato-floar. D. and W. pparently derived from potato-floar. MILLEA'S pithina food, sago-flour, and Scotch fecula seem all referable principally to the same source.

secin au reterious principality to the same source.

Amongst the curiosities worthy of notice is the Typha
meal prepared from the rhizona of T. latifolia, by
M. M. LALLAM, of Leith (133, p. 208).

2. CANADA.—Various barrels of excellent flour are
exhibited, and also of bisenitis; Prize Medals have been

awarded to-J. Simrson and Co. (48, p. 962), for wheat-flour; R. Square (51, p. 962), for catmeal-flour; J. Ross (126), for biscuits.

The buckwheat-flour exhibited by P. TRENHOLME (52, 962) is also very good, and deserves Honourable

 Cape of Good Hape.—A sack of very fine flour from this colony merits Honourable Mention; it is from J. F. Faedenicksen. 5. Australiasia.-After what has been said of the

cerealia of Port Adelaide, it is not surprising that the flours should prove of equal excellence, as is especially the case with those exhibited by H. E. and M. Moses (4, p. 997), to whom Honourable Mention is awarded. VAN DIEMEN'S LAND contributes some barrels of excellent tussack grass from the Falkland Islands, exhibited by wheat flours; one of these from J. Walkers (51, p. 993),

is deserving of Hononrahle Mention: the others appear to have been injured by the voyage. The New Zealand "Maori flour" (or flour produced by the natives) is deserving of notice. Biscurs so extremely well made A. M. MILLICAN (53, p. 993), of Van Diemen's Land;— these deserve especial notice, from the fact that, at a these deserve especial notice, from the met that, at a very recent period, the biscuit served out to the con-victs, and to Her Majesty's Navy, when refitting in Tas-mania, was said to be the refuse of the English Dock-yurds, and was certainly nufit for food.

DEMERARA exhibits muize and plantain meal of good quality.
7. France contributes a most extensive collection of

flours and preparations therefrom; amongst which it is very difficult to select for awards—the speciators are of

such variety, as to merit and kind. The magnificent granux wheat-flour of M. D Annax, jun. (1576, p. 252), has occupied much of the attention of the Jury, not only as the best sample of European flour, but from the exhibitor being the inventor of the gruaux principle in griading, whereby a great saving of the finest and most nutritive portion of the flour is effected, and any wheat flour made to contain more or less gluten in proportion to starch. Hurd whents of all kinds, especially Sicilian, Russian, and Sardinian, from knos, especially Steinah, transant, and Sarvinnian, from the large percentage of glutten they contain, are the best adapted for this purpose. By means of D'Arblay's adjusting process, such grains are first ground high in the mill; the white middlings are then separated by coarse sieves, sad reground low in the mill; finally, the flour is repeatedly passed through fine sitk series. This flour is repeatedly possed through fine silk serves. This process is evidently tedious and expensive; but the flour produced is of the very finest description, especially for produced is of the very finest description, especially for plates, and other preparations of that description. The average produce of flour thus obtained is 25 per cent, from ordinary wheat. Sach flour is extensively imported iato this country, for bettering the inferior flours, espe-cially the Irish. D'Anna-x's household flour, obtained by the usual grinding process, is also of first-rate quality.

A Council Medal has been awarded to Mr. D'Ann.Ay. "for his grunux and honsehold floor, obtained by a novel and economical process, for the fineness of its quality and

utility. Cananga and Ramara have been awarded a Prize Medal for their "thirds flour" (1126, p. 1232), and Arel Lenlance "bonschold flour" (297, p. 1191) has been found worthy of Honourable Mention

Among the great manufacturers of Freach pites, &c., Among the great was been awarded Prize occurs. &c., the following have been awarded Prize occurs. J. V. Maonts (1337, p. 1240), for macaroni, almost equal to the best Italiau; and far what, already men-tioned amongst the ecrealia, and which, from its propor-tion of the prize, &c. Mr. tioned amongst the extentia, and which, from its propor-tion of glutes, is particularly odapted for pates, &c. Mr. Manny also exhibits various flours, with their appli-cations to cullinary purposes, all of great excellence. N. D. M. Fexeux, of Paris, for a fine collection of fecales (202, p. 1193). Vizon Baortness, of Potitiers. VEZON BROTHERS, of Poitiers, fecales (209, p. 1193). for their gluten granulé (1520, p. 1249) and other pro ducts; this gluten is composed apparently of flour mixed with gluten and water. Honourable Meution has been made of the fol-

lowing:jan., Paris (530, p. 1204), for an excellent GRUULT, eollection of feedles, including those of rice, chestnut, and parmentines. C. Clost, de Lille (456, p. 1230), for fine earl barley, vermicelli, and other preparations. J. M. II. Vtolette, für ship-biscuits (1528, p. 1250), prepared

by baking the dough in high-pressure steam. Besides the above, there are various good collections of similar sabstances, as those of Bazon Baornens (40, p. 1173), who exhibit rice, lentil, and pen flours;—of MACHET, a fine series of wheat glutens; - and of Novú,

vermicellis and potato-flours, &c. (1342, p. 1242).

From ALUIESS, a good hard wheat-flour, from LAYA and Co., of Bab-el-Ould (32, p. 1261), of admirable quality, merits Honourable Meation.

8. Russia .- The flours of this country are proverbially good, and those exhibited equally excellent with the collection of cercalia. A Prize Medal has been awarded by R. Bunn (of Edinburgh), is a society worthy of

to M. Roussanorr (66, p. 1368) für hard wheat-flour. Honourable Meution is made of the Smolensko grits of RATSHINSKY (49, p. 1368; prepared from back-wheat, ground ou the grunux principle, being quite a novelty. Revitt wheat-floar

9. Austria.—The wheat-flours of this country, and especially the Croatian, are exceedingly good. especially the Urodatan, are executingly good. I wo samples of apparently a granux flour, prepared by the Pasvilloues Strans Flours Mills Company, Vienna (62, p. 1010), have been awarded a Prize Medal. Jonaan and Banura, of Tetschen, Bohemia (68, p. 1010), exhibited a Croatian flour from a peculiar wheat, which is considered difficult to elean; it is said to yield six to eight quartern loaves per sack more than any other, and has been awarded a Prize Medal. There are various other good flours exhibited by Austria.

10. BELGIUM. - The samples of potato-flour are of nausnal excellence, and Honourable Mension is made of that of G. Beyck (errs (78, p. 1153).

11. Bavanta exhibits a peculiar flour from wheat-grits of exceedingly good quality, but not accompanied by any observations, and probably sent us a cariceity caly, by

Chaistran August Enert (p. 1099).

12. Paissia.—The potato-flour and sago (332, p. 1070) exhibited by F. Wahi, are of greut merit, and have been judged worthy of Honourable Meation for the beauty of the preparations. From the same country WITTEKOT and Co. exhibit a bae series of macaronis and pates (695, p. 1089), to which a Prize Medal lins been awarded.

13. The NETHERLANDS and the DUCHY of HESSE

exhibit pearl barley, greats, flour, &c. 14. SWITZERLAND and SARDINIA contribute pares of various kinds.

15. Tuscany.—The Macanonis of this country are the finest in the Exhibition, both far flavour, texture, and excellence of manufacture; those of F. Paoletti (40, p. 1294) bave been awarded a Prixe Medal

15. Spain and Postwal both exhibit good flour of wheat, but the samples are insufficient. There are also mecaronis from Portugal.

17. UNITED STATES OF AMERICA.-Very fine samples of flour are exhibited from this country, and of 10 rels none fall below a high standard of excellence. Two have been selected as worthy of Prize Medals; one of HECKER and BROTHER (114, p. 1440), who also exhibit the maize farina; the other of RAYMOND and SCHUYLER (128, p. 1441). The extra-Genessee flour of M. S. and L. LEACH is also worthy of notice (155, p. 1446). Of maize-flour, commonly called "corn-meal," or "corn-flour," in the United States, the exhibition is very good. The article is extensively used for puddings and other purposes in that country, and is considered peculiarly wholesome and nutritious; more so than rice-flour, which

is preferred in England for similar purposes.

Наская and Вистика's faring has been considered worthy of Honourable Mention, as has, also, the ficula of the Oswicio Stancii Factory (104, p.1440), which is produced at a very low price. These, and many other samples, testify to the great importance of this flour us an article of home consumption in America.

Malt made from maize is exhibited, perhaps more as a curiosity than an article of importance, by the Onio Boand of Agaiculturae (24, p. 1434). Good pearl barley is shown by RAYMOND and SCHUYLER (128, p. 1441).

A. VII.-OIL SEEDS AND THEIR CAKES

Of this description of sheep and cuttle food there is a telerable supply in the Exhibition, but no samples of remarkable merit, and only one novelty, the cotton-seed cake. Among the various seeds used in the manufacture of oil-cake, fiax (or linserd) is the most important. Rapeseed is also employed, but is considered heating. In the Lubeck department a sample is exhibited of the "dodder-cake," made from the Canelina soliva. A small portion of inferior poppy-cake is contained in the ladian collection. Walnut-cake is not represented

1. GREAT BRITAIN .- The cotton seed-cake, exhibited

special soite, and was wareful Homostub. Meetins. The seed is recommeded as around for the chapsens, The seed is recommeded as forward for the chapsens, the contract of the contract of the chapsens, and the contract of the contract of the contract of the contract is doubtful, and in the shape of off-cade it has possibly to doubtful, and in the shape of off-cade it has possibly to the religious contract of the contract of the contraction of the contract of the conposition of the contract of the conposition of the contract of the contract of the conposition of the conposition of the conposition of the contract of the conposition of the conposition of the conposition of the conposition of the contract of the conposition of the conposition of the conposition of the contract of the conposition of the conposition of the conposition of the conposition of the contract of the conposition of the conposition of the conposition of the contract of the conposition of the con-tract of the con-tract of the con-tract of the con-position of the con-tract of the con-the con-tract of the con-

2. Barriss Earr Isotra.—Flax is most extensively eultivated, especially in the northern province of India, but chiefly, if not wholly, for the oil expressed from the seed; the oil-cake, as a manufactured article, being uoknown. Poppy-cake it, however, occasionally manufactured, and a specimen (of inferior description) is exhifactured, and a specimen (of inferior description) is exhi-

factured, and a specimen (of interior description) is exhibited.

3. Canada exhibits excellent linseed; and the camelineseed of J. Fisher (50, p. 963) is considered worthy of Honourable Meotion.

Honourable Mention.

4. Brazirva exhibits good oil-cakes of various kinds. Honourable Mention is made of the rapesced-cake exhibited by Vencaurese, Boorneass (91, p. 1154), and of the fioseed-cake of J. L. Vencaurenes (82, p. 1154).

 Hamilton.—The rapesed-cake of J. Petraison (5, p. 1136) deserves Honourable Mention.
 Austria, the Netterlandes, Lubeck, and Egypt all exhibit, nore or less, oil-cake of fair quality.
 Sandinia exhibits very good oil-cake of Ghario,

BROTHERS (5, p. 1392), considered worthy of Honomable Mention. (Mentioned also by Jury of Class IV.)

8. Ressata sends various good samples of linneed and seasmum; also of rape-seed, of which the sample exhibited by E. Karnyttch (31, p. 1367) is deserving of Honomable Mention.

 UNITED STATES OF ASSECT.—J. BRIDGE OF New York (346), and LEE and Co., of Boston (530, p. 1467), both exhibit very fine oil-cake, worthy of Honouruble Mention. These are much finer samples than usually reach the English market from America.

A. VIII.-Hors.

The best hops are produced in England, and are chiefy calculated in Keet and Sassay; they are also proven to a limited extent in Sarry; know, Suffoli, Herefordshire, and the state of the

Guarr Barraix.—A Prier Melal has been awarded.
 M. Paras, for his Farinan Colding's loop of Colding and Colding's loop of Colding and Colding's loop of the Pries and of the distort. The soil of this distret is the very finest for the production of hosp, but the growers often got the production of hosp, but the growers often got the production of hosp, but the growers of the priese of the priese

2. Canada sends the best hops that have ever been imported from that country, and which, had they less of the "contrab-leaf" flavour, would fetch a good price in our market. The somples of B. Shitti (64, p. 963), of Skaotsed, have been awarded a Prize Medi, and that of Thomas Dawes and Soys (65) considered worthy of Ilmourable Mention.

 Van Diemen's Land has grown hops for some years, and, it has been said, with success; but the specimens now exhibited are hardly recognisable, perhaps owing to defects in the packing, or accident during the

4. BELLUTH exhibits fair hops and of several varieties; these mak next to the Canadian in point of flavour. The best are the Poperlighe hops exhibited by L. DEGENS (68, p. 1153), WIEDW L. DEGENT (64, p. 1153), MADAME VAN MERIES (65, p. 1153), which are severally considered worth of Honourable Mention.

S. Grand Dicease of Bresse.—The Mayntz hops are of good flavour, well harvested, though rather small, and have been awarded a Prize Medal; the exhibitors are Stein and Schrönzer (81, p. 1129). Some Strashourg hops are also good, resembling Golding.

6. Russa, sends a sample of unripe hops, better than usual, and which, were they attlleiently ripered, would probably rank next to the English in quality. This appears to be a common imported variety of the English "grape hop," and is from Convr Kouchexerr (32, p. 1363):—"It deserves Honourable Mention.

B. - DRIED FRUIT AND SEEDS.

The series of diried fruits is very extensive, and the articles generally excellent in quality. Little novelty, either in product or import, is remurked, and none of invention in preservation. The divisions of this Sah-Class (Bh.), proposed by the Royal Commissioners, are not here retained, the articles being considered in the aggregate under each exbibiting country. Those preserved in sugar have been referred to another Jury.

(Chen XXIX)

The Control of the Cont

2. IONIAN ISLANDS.—Dried currants are exhibited from Cephalonia, by MANROLANII, equal to the Zante

 Eart Indus, "Pickled fruits of the "durion," a production of the Straits of Malacca, are exhibited, but no other preserved fruits, except tamarinds, which were extremely good, and some fine candied fruit of the Œgle Murnelos.

4. Ceylon exhibits tamariuds and myrobalans (the almond-like kernel of the unt of a terminalia); Java, tamarinds.

5. From the West Indian Islanus there are fruits, entire, of the Brazil and (Bertholletia excelso), from Tai-

NIDAD; tamarinds and cashew nuts from Harradouss.

Departure and secretical fresh sonari (butter nuts),
dry banamas in slices, sweet but very poor; the monkeypot froit entire; limes; and bilimbi fruit preserved in
pickle.

6. VAN DIEMEN'S LAND exhibits good dried apples grown in the colony.
7. CAPE OF GOOD HOPE.—A Prize Medal has been

try, except of fruits preserved with sugar.

9. WURTKARIRG. — Dried fruits for home consumption, and apparently much appreciated in the country, are exhibited; such as bilberries preserved in great quantities.

which are flavourless; also some apples, pears, and elter-

ries, which are better.

10. Pavssia exhibits a case of 24 bottles of dried gar-

don and oreland fruits, good, and well flavoured. II. Searts—The collection of Spanish dried fruits deserves Housenable Mention for general carefuses, shained figs, within of great size and good flavour, almostle, Barcelona muts, ground-nuts, pictable muts, election, and elective. Of these the following cubilitors between the state of the collection of

MANSO 1334, p. 1337, fills wis merit Hosournibe Mention. LI. Postroux.—The series from this country is particularly fine, and consists of copions samples put up in large lettice, all of pood quality. Those contributes a fixed pool to the properties of the propert

these and various other exhibitors almonds, walnuts, filberts, chestnuts, belotes, raisins, plums, &e. 13. Gazece contributes raisins, eurrants, and figs; but none of fine quality.

14. Tescant sends pine-seeds, an article of great consumption in the Italian provinces.

15. Tunis.—The collection of dates exhibited by Er-Term Mensex (pp. 1415, 1416), including upwards of thirty

varieties, all in excellent condition, and in great quantities, has been awarded a Fried Medal. Though dates are not imported into this country from Tunis, that part of Africa is celebrated beyond all others for the variety and excellence of this fruit. There are, also, almonds, razins, pistschio-muts, apricoto, and figs.

10. EAVET.—There are seven kinds of dates in this cellection, none remarkable. The fruit of the short methods are the seven kinds of the seven the seven that the seven the

collection, more remarkable. The fruit of the doompalm (Cracifira thebatica) is a novelty, it is commonly called Alexandrian gingerbread, and is much eaten, though worthless as an article of food in English estimation.

17. Truker exhibits an extensive series of fruits and small articles for dessert; but all in insignificant quantities, and very dirty. The jujubes are remarkable for size and variety.

18. Of commutations there are very few exhibited and

18. Of cocoa-nuts there are very few exhibited, and none worthy of notice. CEPLON and the MACRITICS contribute some. The "double" or "sea cocoa-nut" of the SEYCHELLE ISLANDS, sent from the Mauritius, is a cu-

riosity, but not an edible one.

19. Betel-nuts are exhibited from Sarawak in Borneo,
Cevlon, Singapone, and the East Innes.
Though not ranking as "dried fruits," ofives and

Though not making as "dwelf forline" afters and of these the cribidition is stainable. The Seazula of these the cribidition is stainable. The Seazula offers are magnificent, both those preserved in oil and in million is like Ress. "of Maxere, Cassan, Seville (112, p. 1535). Pourvoia, also exhibits salarimble offers, of Maxer, Cassan, Seville (112, p. 1535). The other chibiting countries are Pourr, Austra, and Austra, Arranata, Parks, Salmetta, Care, Pourre cast, Marria, and Sourta Arranata; but, moneya part part of accidence, their is no northy or particular group game of accidence, their is no northy or particular group game of accidence, their is no northy or particular group game of accidence, their is no northy or particular group game of accidence, their is no northy or particular group game of accidence, their is no northy or particular group.

C. I.-TEA.

The exhibitors are few in this division, and have confined themselves to imports from the Eastern World, whence this product is, however, admirably illastrated. Chirak tae is exhibited in abundance, and of the finest quality. The Brittish Indian produce, again, has never before been displayed in England as it is here by the

Assay The Concard, and the Hassochante Corty of Descross of the Rest Italia Company, who send good samples of the Himsley and Java growth in the best consider, and especially from Rio de Jaseiro, as also from Modelra, and especially from Rio de Jaseiro, as also from Chittagong, and various other countries in which the cultivation of ten has been attempted with more or less

BERNAL TRAN — The collection formed by P. W. BERNAL (T.), P. 18/21, A. Caston, expected for this Existation, is quite unrivalled, whether we report the excitation of the control of the c

The Jury regret to find that the rules of the Royal Commissioners preclude Mr. Ripler from receiving any stronger proof of the high estimation in which his collection is held than the award of a Prize Medal. The following scanty data are recorded for the information of the public on a branch of industry which has never he-

fore been adequately illustrated.

Full chests of various Pekee tens are exhibited, some

of which feeth 500, per lh, in the China market; whilst 75, is the very highest price any of the sort will feeth in England, and this only as a finery arricle. The plain and orrange-secrelled Pelevas more fieth little with an 1, in a families. The finest, however, never leave China, being looght up by the mandarian; for though the transit experies and 34, no 6, per lb, to the value when solds in fausti, per leave China, being looking to the price with the properties of 30, no 6, per lb, to the value when solds in fausti, period of the properties of 30, no 6, and the based of some greeiest polaria belonging to the consequent twin, edges and the based of some greeiest of plants belonging to the consequent twin, england the properties of plants belonging to the consequent twin, engage trule, magnetic markets.

furents, oled flowers, &c.

The Cong Souchong, or Ning-young teas are chiefly purchased for the American market. Oolong tea is the favourite drink in Calcutta, though less prized in Kngland, its delicate flavour being injured by the length of the

volvage.

For delicacy, no teas approach those usually called

"Mandarin tean," which being but slightly fired, and

"Mandarin tean," which being but slightly fired, and

Of the Myspus district teas there are eight varieties, they are much prized in the American markets, but not so much so in England. Among the most important consistints in the collections are the cunterfeit teas of Castons, These are made of any refuse, such as most-water in a most-record of the control o

Various carfons tean used by the labouring clauses of Chinese are cabibled; some are merely coarte, and bad, sua-drired leaves; better qualities, chiefy from Ankoy, and the companies of the companies of the companies of latinates of Java, etc. Carfonely rolled and twisted panples, such as the "old num's cyclroves," "ball tes," such as the "old num's cyclroves," ball tes, "defice tean follow these in the series, and counst of cakes, the companies of the period of the companies of the companies of the companies of the period of the companies of the companies of the companies of the period of the companies of the companies of the companies of the period of the companies of the companies of the companies of the period of the companies of the comp

Lastly, there are specimens of the plant itself, leaf, flower, and bud; models and drawings to illustrate the processes amployed in its manufacture, packing, and shipment; samples of the materials need for secuting; ten pots, cups, &c.

Another collection of merit is that of W. P. HANMOND and Co.* (2, pp. 418, 449), which has also been awarded a Prize Medal. This contains, in 40 boxes, the various Prize Medal. teas more or less abundantly imported into England; and is further illustrated by good paintings of the processes employed in the culture, husbanding, and manufacture.

2. Jaca Teas.-Exhibited by the Singarose Con-MITTER Of the HONOGRADLE EAST INDIA COMPANY. These teas are good of sheir kind, but not equal in flavum to the Chinese, or even to the Kemaon. In respect of flavour, they resemble the Assam, but are inferior in

Tous .- Exhibited by the HONOURABLE East Ixula Cumpany (p. 872), are not very fully represented. In flavour these rank next to the Chinese tens: solited. In navour these rank next to the Contiene tens; and as a class, have rather the Ankoy flavour; being better adapted for greet ten than black. The manufacture is much improved of late. Three samples are exhibited; imperial hyson, young hyon, and southoug; for the two latter of which a Prize Medal has been awarded.

4. Assam Tens. Eight boxes are exhibited by the HONOURABLE EAST INDIA COMPANY (p. 872); all full of well-mode strong teas, superior in this respect to the Chi-nese, but much inferior in flavour, roasting, and seent. In point of manipulation they equal the Chinese. For mixing with the Chinese article they find a rendy sale in the English market; and are in every respect superior to the ordinary tea, than which they command a much higher price. The quantities exhibited in these boxes are too small, and have consequently lost much of their flavour during the voyage and subsequent exposur

The grey flowery pekoe is the best sample exhibited; in appearance and flower it cannot be surpassed by any China tea, but is rather wiry in the leaf, from the buds having been gathered too young; whence, perhaps, also its deficiency of flavour. It is of a much higher class than that of Kemaon and Java, and would command a high price in the English market. A Prize Medal is awarded to it.

5, Brick Ten of Tibet, - A sample of this enrious product is exhibited by the Honorague East India Con-PANY (p. 872). It is formed of the refuse tea-leaves and sweepings of the granaries, damped, and pressed into a mould, generally with a little bullock's blood. The finer sorts are friable masses, and are packed in paper; the coarser, as this, sewn up in sheep-skin. In this form, it is an article of commerce throughout Central and it is an article of commerce throughout Central and Northern Asia, and the Himmalyan provinces; and is consonned by Mongols, Tartars, and Thetans, churned with milk, eath, butter, and boiling-water, more as a soap than as tea proper. Certain quantities are forced upon the acceptance of the western ributaries of the Chiuese empire, in payment for the rapport of troops &c.; and is hence, from its convenient size and form, brought into circulation as a coin, over an area greater

6. Assam Tea .- Sent by the Assam Company, and exhibited in the British Department (143, p. 1956). This collection is contained in twelve chests: it is admirable, and in perfect order. As the indigenous plant has been monufactured in Assam, and the China plant has also been introduced and cultivated for the purpose, the exhibitors have judiciously sent samples of the different kinds of ten from each; thus enabling the Jury to establish the superiority of the introduced Chinese plant over the indigenous (or native Assam), for the mannfacture. There is a decided advantage in point of flavour pos-sessed by the Chinese leaf, though the manipulation appears perfectly equal in both.

A Prize Mesial has been awarded to the Assan Con-

than that of Enrope.

PANY for this valuable collection of admirably-prepared

" These exhibitors' names appear in list of Class IV., by which Jury they were also awarded a Prize Medal.

C. H .- SUBSTITUTES FOR TEA.

Of these the Exhibition contains hardly say examples.
One specimen of mate or "Phragany tea" (Hex Paraconvenie) is exhibited as a curiosity. This beverage is in universal use throughout Brazil, Urnguay, Paraguay, the Plate district, Chili, and Peru

Dr. Gardiner's prepared coffee-leaves (142, p. 193*) are worthy of notice, as affording a realty palatable drink when infused as ten is; more so perhaps than coffee is to the uninitiated. That this preparation contains a considerable amount of the nutritious principles of coffee is evident from the analysis; but as the leaves can only be collected in a good state, at the expense of the coffee-bash, it is doubtful whether the coffee produced by the berries be not, after all, the cheapest, as it certainly is the best.

C. III.-Coffee, Cocoa-serds, Nebs, &c.

Under this head the Jury have considered chocolates prepared for use, when plain, ar if only sugared, for ordinary use; and have excluded such as are made into pates, as more properly belonging to the Confectionery Department.

Many good samples of coffee are exhibited from various parts of the world, and amongst them some of excellent description from British colonies, which have never before been known to produce this article. On the other hand, there is a deficiency of specimens from the most important producing countries, as Jamaica, Dominica, Berbice, St. Domiago, Costa Rica, the Brazils, Manilla, and Java

Of coron the same may be said; the best producing countries export the choice of their produce for the mar-kets of Mexico, Spain, France, and Italy; the high dif-ferential duty obliging our manufacturers to be con-tented with the inferior products of Trinidad, Grazada, St. Lucia, &c. In chocolates (manufactured cocoa), France alone is well represented; England cannot here compete, for the reason just stated (under cocoa), and various adulterations are hence prevalent, the chief of which are potato-flour and sago.

1, GREAT BRITAIN.—R. SNOWDEN'S patent purified coffee-nils (28, p. 202) are the produce of an improvement in the method of preparing coffee for the table. The berry is split, and the busk (that formerly adhered to the whole berry), which is usually removed from all but the slit, is here extracted from that also: after which operation the herry is better adapted for reasting. The coffee thus prepared is of the finest quality. The illustration of the process is complete, and ample specimens are exhibited. A Prize Medal has been awarded to Mr. Snowness for his new method of separating the tough membrane from the fulds of the seed.

J. S. Fay and Sons' case of raw and prepared cocon and chocolate (31, p. 202) has been awarded a Prize Medal. This series is extensive, and of fine specimens; Medal. This series is extensive, must of how specimens, illustrating fully, by drawings and samples, the prepara-tion of cocon and chocolate of various kinds; also the plant in its natural state, with its history and manufac-ture, usode of packing and transport. The cocca seeds and nibs are exhibited from St. Lucis, Caraccas, Trinidad, New Grenada, Gnayaquil, Bahia, Peru, &c.
The chocolate of L. A. Monteno (34, p. 203) has

been awarded a Prize Medal for its excellent quality. It is, perbaps, a little over-roasted, if it has a fault. Honourable Mention has been made of W.

нан (38, p. 203) for good chocolnte. G. B. WRITE (32, p. 203) for the same. Other chocolates of fair quality are exhibited by the

PARIS CROCOLATE COMPANY (30, p. 202), but the specimens are too sweet. Besyamin Gritts' cocco (36, p. 203) is fine, but appears rather to be MacDalena than Caraccas, as it professes to be. J. T. Bunus' extruct of cocca (37, p. 203) is apparently damaged by exposure. W. R. LANE's essence of coffee (35, p. 203) is worthy of notice, and has been pronounced equal, if not superior to any similar preparation, though still not so good as coffee prepared by the usual process.

2. East lunus.—The recently extended cultivation

of coffee throughout our eastern possessions renders this

department of the Exhibition peculiarly interesting. The samples are, unfortunately, generally insufficient, dirty,

and inaccurately labelled.

Java exhibits good coffee, but none of marked superiority. Honourable Mention is made of one sample, marked as from the Menado district, which has a good, bold, well-formed berry; and also to some samples from Sourabaya; both are contributed by the "Sixcarons."

Souralways, both are contributed by the "Sincapous, Consulvays, both are contributed by the "Sincapous, Consulver," of the Honoceanis, East India Congaye. The Java coffee is only prized in the market for its delicacy of flavour, as in point of strength it falls short of the West Indian. The samples of Aden coffee contributed by the Ho-

The Hallpher to convert convertience of my control and more resemble the Berbers (Alysanian plant, unaslly earlied long-iserried mocha, that the genuine mochaties are directly and the stafferenty garbeiled (picked). Aden, alass Mocha coffee, is, along with the convertience of the stafferenty garbeiled (picked). Aden, alass Mocha coffee, is, along with the Arab ships, where it is "garbeiled" previously to its being exported to Eagland. The bean is always broad and small, and the climate of India is supposed to im-

prove its favour.

The best East India coffees in the Exhibition are those from the Peninsula, the Wynamad especially, supposed to have been introduced from Douisides, and originally entitated on the West Indian principle. Being always are introduced to the West Indian principle. Being always and the principle of the principle. The principle was a principle of the description of coffee Honoramble Mention is made of the two samples from Mysore, both exhibited by Capinal Moania. The berry is particularly hold and even in

Chittagong, and other excellent Bengal coffees, are

not exhibited, which is much to be regretted, as the introduction of coffee into the eastern districts was effected many years ago, and is due to the enterprise of Sir W. Jones, since whose time the cultivation has been pursued with great cancess by private individuals, some properties of the private individuals. Santon and the Santwak (p. 988), and is avarded a Prize Medal for its great superiority in colour and weight. It is the first anaple from that country ever seen by by days of

Cyrox.—The great extent and importance of the entiretion of office [p. 071] in this lished renders this department of the Jury's belown particularly interesting, percent, excellent, and work heaff interesting, percent, excellent, and work heaff interesting to enveyed by models of the drying-houses, sheels, and implements med in the manufacture of the berry (p. 852) to the local control of the property of the pr

Hosournhe Mention is made of two anuples; income he kitches estate, at 4,500 feet above the set, from the kitches estate, at 4,500 feet above the set, berry; the other from the Humangiru estate, 5,000 feet above the sea, which exhibits good pearl-berry, of peahory codes, a small westly, for which lamadyicking the pear of the set of the set

which, like the wild plant of Bengal, is of no value.

Normon, Islams needs an excellent sample of coffee, apparently of the Berbera variety; it is of good colour, well adapted for rossting, and is a most destinable novelty.

Sr. Helena.—There is an excellent sample of coffee

from this island, from the perinte parks of Mr. S. Mr. S. (Ap. 203), of which Homourable Mention is under Mr. S. H. S. (Ap. 203), of which Homourable Mention is under Derreaman, once the great coffee country, now cultivates very little indeed. Many samples, of various growths, are sent from the few remaining extasts. None are of much merit; the best (that from the estate "Nich Pouderopen" is good. Pent-berry coffee is also exhi-

bited, and poor samples of corea.

Barbapore sends corea of no merit.

Taxixaa exhibits very poor coffee, apparently degecented from plants originally of modes; and from its created from plants ariginally of modes; and from its The coors from the same ridand is rithy sugmitheen, and such as is sever reen in our market. Mr. Prauss, of Her Majerty's Ibstante Garlen, Trainfald, to when the feeting, sends ecces as prepared for both the English and Spanish (p. 574). With regard to the Spanish, such has round, ripe, chan, and of a fine heigherted colour. The English is good of in kind, but it, firerally, the refuse of and offere bitter. A Prize Medal in swardest to the

Spanish samples.
WEST AFRICA contributes indifferent coffee.

Posttogal, sends a very valuable series of coffees from various of her coloules; of ordinary description from St. Thomas; tolerably good from the Care, no Vasus Islances; bad from Thom; worse (but earlows from the very small size of the herry) from Mozamager; good from Asocola; and excellent from Maueira.

Phaseca: "There is a very extensive collection of eho-Phase care the present series of the herry than the present series of the herry than Mozamager; good from Asocola; and excellent from Maueira.

FRANCE. There is a very extensive collection of elocalest from this country, and some coffees also. Upwards of fifteen exhibitors contribute largedy, and the Medial have been awarded to Gar, viz. --F. A. TCRING (1946, p. 1228), who exhibits chocolate in every variety of from and flavorn, it the highest perfectlor, if. E. Peñanco (205, p. 1183), for the collection of the contribution of the contribution

Honourable Mention is made of the following: -C. CROQUART (1149, p. 1233), for chocolate; MENIER and Co. (925, p. 1224), for chocolate.

Hononrable Mention is also made of the Cho'en, a preparation of coffice and chorolate blended, sufficiently agreeable to the palate, and apparently wholesome and pleasant. The exhibitor is A. E. LEMOLT (303, p. 1191).

1191).
SWITZERLAND, SPAIN, PAUSSIA, and the NETHER-LANDS, all exhibit fair chocolates. Territy sends three samples of the Mocha variety of coffee, not remarkable, and of the usual or Egyptian class of berry.

C. IV.—CITICOM AND OTHER SCINITUTES FOR COFFEE.

Judging from the number of exhibitors and samples,
the cultivation of chicory is far from being extensive or
remmerative. Few of the specimens seat are of much
value, and sonce can, under any circumstances, represent
coffee in flavour. As an adulteration, the chicory may be
profitable, and, supposing this to be its principal use, the
exhibition of much was not to be expected.

GRIZAT BRIVAIN exhibits one sample only, and that very good indeed, meriting Honoramble Mention. It is from SAXYERES and GAYCHALL, of Dublin 1144, p. 1539. Honoramble Mention is also made of "Modar Set denistry prepared inhibition of coding, much superior to minthly prepared inhibition of coding, much suspector to any, Honoian, for beautifully cut and pecied dried chicery (69, p. 1368).

lesides the above, there are samples from Butswarren. Presensa, the NETHERLANDS, and Illuse, nose of nucleimportance except the preparations from Patients. There is a curious need exhibited from Tarkey called "Kengnel," it is said to be extensively cultivated in the Kair-ar-ch and Konath; and ronsted, ground, and need like coffee. The plant is the "Guntelia".

D. L.—FERMENTED LIQUORS.

The Rules of the Royal Commissioners were opposed to the exhibition of any objects of this class, except such as were remarkable for novelty of invention or production, hence the number exhibited is very limited.

A Sardinian orange wine, "Vino di Avancio" (9, p. 1302), is quite a novelty, and apparently a valuable one. This wine is prepared by P. Gatassini, of Geaca, solely from oranges that would otherwise be wasted: it is a remarkably agrecable bevezage, strongly recembling fine

Lanel in flavour, aronus, and quality. A Prize Medal has (40, p. 203). The eignrs smoke well, with a good white been awarded to the manufacturer.

In the Zollvere'o Department is some well-fermented good beer (1.5, p. 1688), smallentruely for long yoyages, by C. Cantertant. This was tasted, and found sound and good but too week; and being flavorened with absinthium, was unsaited either for the English us Indian markets, the control of the Company of the Company of the Company inquiry, to be highly reliabed by the beer-drinkers of Germany.

The Austrian "biot serior" is a hard, dry, and tough muss, fabricated from an extract of and and lape only, and anglement to the task, and fairly pertible. There probably with ligarious. Berw may prepared from each of these fee the Jusy; by the Exhibitor, after considerfree from any amplement favour, we at his and to atgreable to the English polate. The preparation had certainly start to the properties of the properties of the constant seriously affect in qualifician as prombal articles and the time close to a feet the properties of the propared of the properties of the properties of the propared of the properties of the properties of the properties of properties for properties been from it, nother it, prescribed, not properties for properties beer from it, nother it, prescribed, not properties for properties beer from it, nother it, prescribed, nother in prescribed, nother in prescribed to properties for properties beer from it, nother it, prescribed, nother in prescribed to the properties of the properties for properties and the properties and the properties and the properties and the properties of properties and the properties and the properties and the properties are properties and the properties and the properties are properties and the properties and the properties are properties and the properties are properties and the properties are properties are properties and the properties are properti

D. H.-Товассо.

The exhibition of nw and manufactured tulucco is upon the whole one of the most suifactory of the class on which the Jary were called apon to decide. The import trade is very fully represented by anmerous amples of receilest articles. The British, German, Algerine, and United States manufactured tobaccon for smoking the famous smif-mills of Scotland, Ireland, Portugal, and Austria are all allows.

I. Instruct Extunerous—The leastful cases of W. BERSON (20), 20.3 law been awarded a Prize Media they contain as epitome of the London tobacco trade; and amongst them a too of Herstannia (spirit, televel: "Pre-modern of the Control of the Control

equatericided flat only cigans called "Burwan".

Amang other raw or feat forbacco, the American varieties are porticularly well illustrated, but too insufficiently lands to overly much information to the public, the commoner "shag tolonco" is propared chiefly from the Commoner "shag tolonco" is propared chiefly from the "Mason" county leaf; the until lamanter and similar qualities from the thin, delientely flavoured, mild, this in the royal arey, from the Virginia leaf, &c.

Hungariaa tohaceo, almost suknown in Great Britain, is also exhibited both in this and in the Russian Department. It is very fine, and of peculiarly delicate flavour, much more so than the tobaceo usually cultivated in Turkey.

A Prize Medal has been awarded to Brs. Joxxa and Co. (43, p. 203) for their collection of Ibavanash ejgars, illustrating the English market. These are selected from the Exhibitors' stores, and are somewhat unequal in quality, and being picked for exhibiting, nor are they dressed awardes.

Cones and Onn (49, p. 204) have been awarded a Prize Medal for their Havannalis, "Ugues" brand; a very good eigar, imported by this firm only. Unatile mode along are conjugate with history

very good ergar, imported by than into both.

English-made cigars are copiously exhibited.

E. Joans and Brownesse (42, p. 263) have been awarded
a Prize Wedal for their very fine collection of different
varieties of cigars manufactured from the Havannah
leaf. These are sold at a very cheap rate, are beautifully
rolled, draw well, and are of fair flavour, the latter being

a quality mattalaable in perfection in England.

Lawaarr and Bettara have also received a Prize Medal for their excellent tobacco, cigars, sunffs, and Cavendish.

ash, and are of very fair flavour. The cut tolonce and sunfis are of excellent quality. Negro-bead and Cavendish are also exhibited, and are successful initiations of the American produce, though inferior in flavour. They are prepared by a peculiar process from the best Virginian leaf. A specimen of English-grown tobacco from the same exhibitor is worthy of notice, as a curiosity: it was raised on a poor light soil in Cambridge-shire, and is

as excellent specimes, but deficies in shavour.

Ricramanous Bancrusas, of Edishmaph (162, p. 204),
have been awarded a Prine Medal for their very fine
very fine awarded a Prine Medal for their very fine

A Prize Medal is awarded to the snuff of Messes, Lexev Foor and Co., of Dublin (44, p. 203), an article too well known to require more special notice, and of which the Exhibition samples are admirable.

which inexchanges suggested as the state of the control of the con

in which it is originally part up for expert.

M. HYAM' (p. 200) samples of fittish-made cigars and electrons, from the New Granada leef, deserve mutics from their extraordinary chappens, a does his specimes of Collandain tobacco. The Jury also meetino Birxa-kava and Torata (48), p. 20%, for their early-shelicated cherousts of tobacco and other marvoits berin and drugs, the most contracting visits and their contractions of the contraction of the contraction of their contractions. These cheroust draw well, but are very rank.

The Care of Good Harz schibit cajers and knauser

vention). These cheroots draw well, but are very mark. The Care of Good llars: exhibits cigars and kanaster tobacco (36, p. 950), grown in the colosy. The defects of the cigars seem to be in the manufacture and choice of leaf, for they are spongy, tough, and leathery, most clausily made, and smoke with a black sab. The flavour is, however, so far good, as to indace the Jury to encourage improvements in the colony, by the award of Ho-

rage improvements in the county, by the award of 10aourable Mention to N. Moss, the exhibitor. Canada contributes very fair leaf-tobacco for cigarnaking, from J. Lever (73, p. 963), of which Honourable ascation is made: it equals second-class Virginialeaf, and will probably be much improved by care in the

East India —The Honoranna East India Conraxt centribute Sourhaya (Ana) chrotos, of two qualities the first, a dark-coloured sample, are very well discoured, with a fair ash; they hurn pretty steedily, and rather strong, and are better than any English-made cigars, but siderior to the Manilla. The lighter-coloured samples are weak and poor. The Trichianophy cheroons exhibited (p. 873) are singu-

haly come made find; these, mover toyal in interlogue, that constrained for the second property of the country, have possibly been injured on the voyage. Some "Calcutta Manillas," as initiation Manillas are generally called, of five (almont) flavoured followers, hurn with a white sale, and are equal to second-class. Hawanakis (p. 532). Honomrable Merition is much of them, and of the Chinsurah Havanakis, manufactured probably from "Saad-cheal" tobacce, cultivated on the Armana

i from "Saad-head" tobucco, cultivated on the Armean t coust.

The Jury regret not having found in the East Indian

The Jury regret not having found in the East Indian Department, samples of Awailan and various other raw tobaccos, raised in different parts of our Eastern possessions; or of the Luska cheroots, made from tohaccogrown on the banks of the Godavery and Mahanuddy rivers, where its cultivation and manufacture are rapidly

increasing, and the cheroots are superior to any others TRINITAD scade cigars, very clumsily made, and defi-cient in aruna, but which have been awarded a Prize

Medal, for their excellent mild almost flavour, and for the novelty of the manufacture, which is worthy of en-

into the market

couragement (p. 974).

A great deal of tolorceo is exhibited from the Northern States of Europe, BELGIUM, the NETHERLANDS, &c.; of the manufactured produce, Honourable Mention is made of the cigars (69, p. 1145) of A. VAN DER LANDEN, of HOLLAND, which are composed, some of Dutch and some of Java tolorce. Also of the cigars of J. P. MCLEST (11, p. 1126), of the Grand Duchy of Hesse. Paussta exhibits various samples, generally of common and coarse cigars. Homourable Mention is made of those of A. P. CARSTANJEN Sons (468, p. 1077), which are better flayoured and mure fragrant than any English-made article. AUSTRIA sends many fine snuffs.

The most important exhibition of German tobacco is that from Maunheim, sent by Wn. Sacus, which, unfortenately, owing to the lateness of the crop, arrived too late to be placed on the Award List. It is but fair to the producer to state that it has been pronounced superior in flavour, and in point of curing, to any European tobacco known in the English market. The Agricultural Society of Badea has encouraged the culture of this crop, which has rapidly increased to 200,000 cwt., annually grown on the banks of the Rhine. The enltivation is carried on the banks of the finite. The children is carried on by small proprietors, and employs 20,000 hauds; and the produce is sold at a very cheap rate. It is exported in leaf, in vast quantities, to Eugland, Belgium, Spain, and, in bad scasons, to the Havannah itself; and the cigars are consumed in the United States to a great amount. Great attention is paid to the selection of fine covering leaves, upon the goodness of which the hurning and drawing so materially depend; and in this the manufac-turers, judging from the samples exhibited, seem to have been eminently successful. Though still inferior to the best American tobacco, it surpasses much that is brought

The Spanish Department excels all others in the beauty and variety of its cigars. The Havannahs are here alluded to, for the Manilla cheroots are scarcely represented in the Exhibition, which is very much to be regretted

The best Havannah tohacco farms are confined to a very anrow area on the south-west part of the great island of Cuba. This district, 27 lengues long and only 7 broad, is bounded on the north by mountains, on the south and west by the ocean, whilst eastward, though there is no ostural limit, the tobacco sensibly degenerates in quality. A light saudy soil, and rather low situation, sait the best. Of the small collection of cigars shown, two exhibitors have been awarded Prize Medals. The one, Don BEENAVENTURA GONZALEZ ALVERA, for his "Ramas" eigurs (126, p. 1336); these are considered the best it is possible to produce, and fetch 30l, per 1,000 in the Havananh. They proved extremely fine in flavour. and perfect in burning qualities, but they were so tightly rolled as to draw with difficulty, which is rather considered an advantage by the Spaniards in this eigar, other Prize Medal was given to a much milder eigar, other Prize Meets, and considered equally deliciously fla-drawing freely, and considered equally deliciously fla-voured, by the Jury; the exhibitor is known as De Cananas and Canazal (1268, p. 1336). There are also in the Spanish Department a few Manilla

cheroots, some beautiful samples of the Manilla leaf, from the three principal districts of the island, Visagas, Ygurotes, and Cagayan, and some admirable eigarillus.

PORTIGAL exhibits eigars, eigarettes, cut tubaccos, and sauffs; of which the latter are very good, and well cured. There are two qualities of eigars, the one is too mild, but excellent in flavour, and burns well; the other is a compressed darker eigar, resembling the Havanuah "Bravas," delicately flavoured and sufficiently strong. A Prize Medal is given for these eigers (1203 & 1207, p. 1318), fabricated at the Royal Tobacco and Smiff Company. There is also a great number of anuffs from the ume Company, and from other manufacturers; of the former, Honougable Mention is made of Nor. 1172 & 1183

(p. 1318). The others are, for the most part, too much flavoured with orris-root. The eigarettes are very hi-

ferior to the Spanish. ALGIERS contributes an extensive assortment of tobaccos of many kinds: it is becoming the great tobucco mart of Frauce. Both the Havannah leaf, the Syrian, and the Manilia, appear to be cultivated and cured by Arabs as well as colonists: the specimens sent are from exceedingly well-grown, beautiful crops: the curing is perfectly well-grown, beautiful crops: the curing is perfectly well conducted, and the rolling, &c., of the cigars is sometimes faultless; all are, however, utterly deficient in flavour and strragth, being small, poor in quality, and very pule-coloured. The Krucheua's cigara are the best, and of the tobacco, a sample from Oran, resembling the Shiraz. Some Philippine Island leaf, exhibited by M. Monis, of El Biar, is very fine, bot in appearance only. There are some cigars made from the imported Havanuals leaf, sold at an extraordinarity cheap

rate, and eignrillas still cheaper.

A Prize Medal has been awarded to the magnificent A Prize Medal has been awarded to the magnificent TURKHSI collection of buzzar tobacces: it is extensive, and the samples are all particularly fine and abundant, Latakin of the best quality in carbibited here, dark in colour, and if a good tarry flavour. The Moldavian tobacco is also particularly fine. The Jury much regret their inability to give any detailed account of this admirable collection, information being wanted on the sub-ject of the growth of the fluor qualities of Oriental to-

acces particularly

Pessta is justly renowned for the quality of its to-baccos, both mild and strong: of those, the most celebrated amongst the milder performed sorts, is called "Aburika," or "Father of Perfumes i" two samples are exhibited; one, the urdinary dark-coloured, in leaf; the other, loosely twisted into a roll, is paler, more prized in the country, and given as presents amongst the nobles. It is much too mild for appreciation in England, however delicate the flavour. The Damascus tobacco is of the same quality as the celebrated Shiraz, pale-coloured, but rather thick and firm in the leaf, and very strong.

EGYPT sends two bales of "Gerbali tobacco," culti-

vated, we believe, in the Delta of the Nile, and made into cigars ordinarily used in Egypt; but even there con-

sidered very inferior

RUSSIA. - The exhibition is small, bot the samples all RUSSIA.—1 he exhibition is small, bot the samples all of good quality, especially the eigarillas of A. SPIGLAZOY?
(76, p. 1369), which are as large as ordinary cheroots, and supplied with a short broad reed-tube at the mouth end, a piessant contrivance. The tobacco used is Russiangrown, very mild, and rathers weet-flavoured, though not aual in aroma to the Havannah cigarillas. A Prize Medal is awarded them. Hosourable Mention is unde uf the Turkish tobacco (75, p. 1369), grawn is the Circasian Provinces by Mistarita Idanor, which is equal to the best grown in Turkey.

UNITED STATES OF ANERICA.—The exhibition is chiefly of Cavendish tobaccos, and is both extensive and

admirable; the contributions of many makers attesting the importance of the manufacture, and the prevalence of chewing, for which these are principally used in the United States, whilst in England they are most prized as the strongest and best flavoured for smoking. The finest Virginia leaf is used in the manufacture, which consists chiefly in carring and pressing the leaf into flat square cakes of various sizes, a little molasses or sugar being sometimes added. Prize Medals have been awarded to— DILL and MULCUAREN (273, p. 1452) for their Cavendish; James H. Grant (284, p. 1453), Black Cavendish; Poirtaux Romisson (265, p. 1452), Cavendish.

Honourable Mention has been made of Mooklas and Honourable mention and documents above a source and CHILES (8, p. 1433); Thomas and Co. (268, p. 1452), for Cavendish:

JAMES Thomas (528, p. 1467), for Negro-head. Also of the Maryland leaf toloacco and eigans, exhibited by the MARYLAND COMMITTEE (included in Prize Medal awarded by Jury of Class IV.)

-SPICES AND CONDIMENTS, VINEGAR AND PICKLES, CINNAMON, Cassia, &c.—This product is at present confined to the Continent and Archipelago of India, where various number are next more lowerer, equal-to-the term from the control of the control of

The other is a starch from a stardard starch from the starch from a starch from a stararowarous, which, in every respect of fred and taste, it

tentententhrough the Exhibition, but do not appear important.

G.-SUGAR

A very limited number of samples of this article are exhibited, and the deficiency is most marked in the contributious from the principal sogar-growing countries. For instance, Januica, Tobugo, St. Vioceat, and every other west fullam colony, except Tribaidad, Demerara, and Barbadnes, have failed to send specimens. There are noue from the foreign possessions in the Old World, Porto Rico, the Brazils, or Havananh, none from Manilla and China, whist Java and Madras send little more than

one sample each.

In refined sugar the British manufactories are wholly unrepresented.

A specimen of sagar, from cane grown in England, deserves notice as a curiosity. The sample was made without filtration, by Dr. Evans, from case grown by II. Penkins, Eq., in Surrey.

EAST INDIAN POSSESSIONS.—A sample of Ganjam

ALTERIANS. PORTECUTION.—A sample of Guijan Land Parks. Portection of the Conference of the Conference

Ja's achilists two fair samples from Souralays, to which a Print Medha base here awarded: both are elapsed sugarst one is said to be manufactured on a new (undescribed) plant, the other by the two repeasure reasonapus process; both are superior to the ordinary. Datch (Xq. p. 9.6), from the Phenart ceates of Wass Bhorrisas and Co.; it is a spleudid sample, dry, well erystallized, produced by the reasonaps and passing process; but perfectly granulated and free from coloning matter. PALN SCOARS. These are exhibited chiefly as enricalties, and coasis of Geometri-plan magar (Arreage acceluraforu) from Java; date-palm sugar from the Decean; Nips angar (from steam of Nips firstlears), probably from the Sanderbunds, exhibited by the Honorevants the Healy flower of Bazaria Injefish, as Amar Indian tree, from whose fleshy flowers, after fermentation, an ardent spirit a distiller.

GRAPE SUGAR is exhibited of fair quality from Tunis and from the Zollverein States; also, as molasses, from Spain.

LAQUORICE.—Nothing of any importance is contributed of this description. The Spanish is almost the only sample: it is very good.

ANIMAL KINGDOM.

II. I.—PRESERVED ALIMENTARY SUBSTANCES,

It is impossible to over-estimate the importance of these preparations. The invention of the process by which similar slow expectable food are preserved in a fresh and sever state for an indefinite period has only been considered to the process of the process o

1 - Choose

cold elimates, their use was extended to hot mes, and for serve to advantage. The more farinaceous do not prethe siek on board ship under all eircumstanees. Hitherto they had only been employed as a substitute for salt beef or pork at sea, and, if eaten ashore, it was, at first, speedily became evident, especially in Itsia, where European families are scattered, and where, consequently, on the shughter of a large minual, more is wasted than can be consumed by a family of the ardinary number. The consumption of preserved means became, at nace, enormous: hundreds of tons are annually transported to the East Indies and all our colonial possessions, and many are consumed by our fleets.

The cheapness of these preparations is most remarkable. This arises from the processes and materials for the cases being inexpensive, and from there being no waste of the meat: all that is good goes into the case, which is always filled. It is affirmed by the manufacturers and others, and probably with truth, that meat in this form supplies troops, and the fleet, with a ebenper animal diet than salt provisions, from avoiding the expense of casks, leakage, brine, bone, shrinking, stowage, &c., which are all heavy items, and entail great waste and expenditure: added to this, the damage of one eask of salt ment risks the loss of all its contents: whilst the meat emisters are, comparatively speaking, imperishable, and an accident to one occasious a loss of at most but from 2 lbs. to 4 lbs. of food,

Several hundred canisters of meat are exhibited from various countries, and in some of these by many different persons. Their merits were tested by a selection from caeb: the cases were opened in the presence of the Jory, and tasted by themselves; and, where advisable, by as-sociates. The majority are of English manufacture, especially the more substantial viands; France and Germany exhibiting chiefly made dishes, game, and delica-cies-of meat, fish, some, and vegetables.

The Jury desire to draw attention to the fact of viands of this description being extensively prepared in Australia, Tasmania, the Cape of Good Hope, Canada, &c., of equally good description with the English. Animal food is most abundant and cheap in some of those colonies. In Australia, especially, during seasons of drought, lt is wasted in extraordinary quantities: flocks are slaughtered for the tallow alone, and herds for their bones und hides. Were the meat on these occasions preserved, it cannot be doubted that it could be imported into England, and sold at a cheaper rate than fresh meat in our metropolitan markets, to the great benefit of the lower classes

Among all the preparations exhibited by France, England, &c., there is no perceptible difference either in the mode or perfection of preservation. To seal, bermethe mode or percention of preservation. To seal, secure tically, full tin canisters is the general principle adopted; and it is effected by plunging them in boiling water, and soldering a small orifice left purposely, by which all the air is expelled; this principle, variously modified, being the same throughout

The contents of all the eases, of whatever kind, have lost much of the freshuess in taste and flavour peculiar to newly-killed ment: they are always soft, and, as it were, overdone: the untritious principles are, however, perfectly preserved. As nutriment they are unexceptionable: they are wholesome and agreeable, and often pleasantly flavoured. Vouchers are given for some of the samples tasted by the Jurors having been preserved for twentyfive years and upwards: these were in a perfectly sound state, and did not perceptibly differ from the contents of canisters only a few months old. So long as the scaling remains sound, the viands appear to undergo no change. Any difference between the contents of the properly-prepared cases is to be attributed to the state of the food before preparation, or to the cooking, and not to the method employed for preserving, which is simple and universally applicable.

Vegetables, preserved in a similar manner, have been considered by the Jury with the animal food. Generally speaking, their flavour is fresher than that of the ments, especially in the case of those abounding in saccharine principle, as bect, currots, parsneps, salsafy, which pre-

serve so well, such as green peas, &c.; whilst those abounding in volatile oils are hardly worth preseggation at all (especially cabbages, turnips, and celery), except as anti-scorbutics. M. E. Masson's dried compressed vegetables (1348, p

1240) demand especial actice, as showing one of the most remarkable discoveries of modern times in this branch of manufacture: they have been awarded a Council Medal, By M. Masson's process, the most bulky, soft, and sueculcut vegetables are reduced to a fraction of their volume, and are preserved in a dry, indestructible state, After boiling for a rather longer time than usual, they are restored to something of their original form and consistence, retaining all their nutritious principles, and much of their flavour. Chollet and Co., the manufacturers of these preserved vegetables, use only desicention and compression in the process, which is Masson's invention. According to a statement published in the "Comptee Rendus," as read before the Paris Academy, the vegetables are reduced seven-eighths in weight, and propor-tionally in bulk. They require to be builed for oue hour tables are recuced serves against the boiled for one hour tionally in bulk. They require to be boiled for one hour and a half to one hour and three-quarters, and on cooling, are found to have regnined nearly all their evaporated

If, as the Jorors have reason to believe, these preparations retain their good qualities for several years, they cannot be too strongly recommended in public attention, it would probably be necessary for long voyages that these square cakes be packed in perfectly dry casks or tauks, as biscuits are.

In the British Department, J. II. Gamble (12, p. 201) and RITCHIE and McCall (15, p. 202) exhibit very fine samples of preserved viauds and vegetables, and to each a Prize Medal is awarded for excellence of material and preservation. Richie and McCull's articles deserve especial notice for the great size of the pieces of ment, combined with all the firmness of texture that is attainable. All are said to be prepared by Goldner's process, the results of which are equal, but not superior, to the ordinary process, as far as the Jury could decide, after a very

protracted examination and comparison. COPLAND, BARNES, and Co. (11, p. 201) exhibit few leads, but abundance of fish, hams, and vegetables. dressed in various ways. A Prize Medal has been awarded for these in conjouction with the admirable tart-fruits referred to elsewhere

A preserved pig, entire (14, p. 202), a conspicuous feature in the English Department, deserves notice as a remarkably successful instance of curing on a large scale.

J. and J. P. LEONARD's fresh meats (26, p. 206), prepared on Toplin's principle, are not so successful a snuple of preserved animal food as would be imagined from their appearance of freshuess und goodness. WHITNEY's fresh beef (grated?) (26, p. 202) looks sound, but is not exbibited in sufficient abundance, and particulars of trial are wanting

MADANE D. St. ETIENNE exhibits specimens of vegetoanimal substances, ment flours, &c., prepared for voyages; also a bottle of dried and pulverised spinach (138, p. 208), of which Honourable Mention is made. It is a p. 2053, of which itonourable election is make. It is a curious preparation, resembling M. Masson's; but the quantity exhibited is too small, and the general applica-bility of the process is not known. Canada demands very prominent mention for the abundance and excellence of the preserved viands exhi-

bited; but all are of the ordinary description of cured meats, and none have any peculiar merit or novelty to entitle them to reward, except the bams of G. Reix-Hardy, of Montreal, which have been awarded a Prize Medal. There are barrels of beef, pork, and tongues, cases of smoked hams, bacons, and sausages, kegs of lard, &c., all produced at a remarkably cheap rate.

NEW BRUNSWICK and NOVA SCOTIA contribute excel-

lent fresh salmon, preserved in tin eauisters, and quite equal to the English. Honourable Mention is made of that of T. HOLLIDAY, of Halifax, and W. J. FRAMER, of Miramichi (24, p. 969).

AUSTRALIA.—11. E. & M. Moses (101) are exhibitors of excellent preserved fresh meats, in all respects equal

to the English, but exhibited in small quantity and in no variety. Honourable Meation is mode of them. The New-CASTLE (N.S.W.) PRESERVING COMPANY (7, p. 989) contri-butes admirable boiled mutton in tin cases, whose especial goodness is evidently owing to the execllence of the material, for the process is the ordinary one, and its peculiarities are the same as the English. A Prize Medal has been swarded the Company. Some excellent spiced beef hams were exhibited by J. BRILARS (2A, p. 989), which have received Honograble Mention.

van Diemen's Land sends excellent hams, prepared by Marshall, of Hobarton, and exhibited by F. Lirs-come (297, p. 992), of which Honourable Meation is Also good preserved ments prepared by Aucocx, of Hobarton (p. 992).

New Zealann.—Some dried mullets are exhibited from this colony, cured for the Chiua market, which appear sound, but not high flavoured. The Care or Goon Hope sends casks of salt beef and

pork, both of good description.
FRANCE.—The collection of hermetically-scaled means

is very extensive and good, but differing from the English in the same degree as a French table differs from an English one, namely, in the smuller quantities preserved, in their being generally made-dishes, and in a greater proportion being objects rather of luxury than of common use. A Prize Medal has been awarded to GUIDERT, DES LANDELLES, & Co. (1262, p. 1237), for a very fine series of preserved meats and vegetables, and to CHEVET, peries of press' series are executive, and vegetables, especially truffles. Of the latter there are many exhibitors in the Freneh Department, and all are good. Honourable Mention is made of the "moutton roit," and sardines in oil, of J. PENEAU (950, p. 1223), also of the preserved game of GRENAILLY (246, p. 1188).

For vegetables is particular, Honourable Mention is made of the preserved green peas of F. ROCHIKE & Son (994, p. 1226), and of the salssify of RÖDEL & Son* (992, p. 1226), which were the two best amongst many samples of all kinds of preserved vegetables exhibited by them in this department. are abundantly exhibited, and the Jury have

made Honourable Mention of the santines in oil of A. Gillet (521, p. 1204), Pellier Brothers (948, p. 1218), and M. Cam's (789). AUSTRIA is almost the only other contributor of fresh

meats preserved by hermetically scaling. Honourable Meation is made of the preserved larks of C. Well. (25).

SPAIN sends a good supply of beef, pork, bacen, and hams, all of excellent quality. The hams are particu-larly good, especially the Montanchis hams (139n, p. 1337), to which a Prize Medal is awarded: it is exhibited by, and sent from, the Bosoucht of Aviles. There is so some good Spanish salt butter,

LUBECK contributes a selection of hermetically-scaled provisions in tia cases, all very good. A Prize Medal is awarded to the exhibitor, D. H. Carstens (2, p. 1140). Switzemand.—Some fish and meats dried and preserved in a fresh state by simple desiceation, are very re-markable. They are exhibited by II. Barr (52, p. 1269, 1270), to whom a Prize Medal is awarded. They want flavour, and are discoloured, but both the muscle and fat of the meat are perfectly sweet and fresh. Simplicity and cheapness of preservation are the great recommendations of these articles, to which may be added the absence of any foreign matter. They will apparently keep well, but they want testing hy exposure to a damp tropical cli-mate, and by confinement in bulk. Russia exhibits dried fish, apparently is exceedingly

good order. UNITED STATES.—The hauss are of a very superior description indeed, and have been pronounced by com-petent indiges to be unsurpassable. Prize Medals have

petent judges to be unsurpassable. Prize Medals bave been awarded to two contributors of this article, Charles DUTTELD, of Louisville (363, p. 1459), and Schooler and Hough, of Cincinoati (200, p. 1449). The lard is exceedingly fine, and Honourable Mention is made of that of G Doninic (21, p. 1434), also by Jury of Class IV.

11. 11.—PORTABLE SOUPS, CONCENTRATED MEATS, &c. A more simple, economical, and efficient form of nortable concentrated food than the American meat biscuit of GALL Bonnes (524, p. 1467) has never been brought before the public. The inventor combines the best when flour with the autriment of the finest beef, and presents them for use as food in the form of a dry, incdorous, that brittle cake, which will keep, when dry, for an unlimited period. It only requires hot water and sensoning to the taste to produce a first-rate agreeably-flavoured, highly-nutritious soup, somewhat of the consistence of sugo. One pound of the biscuit contains the nutritive matter (fal excepted) of five pounds of prime beef, mixed with half a pound of the lest whent flour. One ounce of the biscuit grated, and boiled in a pint of water, forms a rich nutritious soup. It is averred by the inventor, and he is supported by authority satisfactory to the Jury, that 10 pounds of this satisfactor, with a proper allowance of water, afford, both in bulk and nutriment, food sufficient to support the physical and mental powers of a bealthy working man for a month. The Jury further believe it to be as portable and unchangable as the inventor de-

Chemical analysis shows the proportion of meat to starch to vary in different samples, but that in all cases the meat is perfectly sound and free from putridity, and the starch unaltered. Ou an uverage it contains 4'9 per the March ulliance. On an inverse it consumers per cent, of introduce, or 3185 per cent, of fibeth-forming prin-ciples. A Council Medal is awarded to this excellent preparation of Mr. Gall. Boaden, The osmazome of G. Wajashen (Cl. III., 21, p. 202) is

the nutritious matter or juice of meat which is set free during the operation of boiling down fat for tallow in Australia. This is afterwards concentrated and preserved in the form of sansages. A great amount of untriment is thus obtained in a portable form, and when boiled with gelatine, it forms a pulatable diet. The price is very moderate, is, per lb., and it hence communds a market and is much used to form a gravy to meat. The exhibitors declare that one nound weight is the equivalent of the nutriment of 30 lbs, of fibrine, which argues a high economic value. Chemical examination gives 2 l per cent. of nitrogen, or 15:63 per cent. of fiesh-forming principle. Hononrable Mention was awarded,

De Liscort & Co.'s " biscuit beef," in the French Department (1328, pp. 1239, 1340), in form resembles ordinary coarse ship-biscuit, of a large size, and has an animol, sal and nnt very agreeable taste, It is exhibited in two forms, the ordinary biscuit above mentioued, and another marked P., which is to be ground up and boiled, 30 or 40 minutes, as soup. 600 grammes (equal to 1-322 bs, avoir.) are stated to be the equivalent of a soldier's complete daily rations. PRISERVED MILES. - Several specimens of these valu-

able preserves, possessing vorious degrees of merit, have been submitted to the attention of the Jury. Of these the "Concentrated Preserved Milk" of E. D. Moone (139, p, 193*) has received a Prize Medal. It contains all the sutritions qualities and much of the flavour of fresh milk, J. H. Ganale (12, p. 201), and Retente and McCall. (15, p. 202), both exhibit preserved milks in hermeticallysealed cases, but the samples from each vary considerably Honourable Meution is made of MARTIN DE LIGNAC'S

consolidated milk, France (922, p. 1224). Tent of V. B. Fadeuller (Cl. III., 140, p. 193*) is also worthy of thorice as a curious preparation; but it appears to attract moisture, and has a decided flavour of cheese. The preparation of Outsia & Co., of Paris (1375, p. 1242), and the Lubeck preserved milk (2, p. 1140), are too much sagared.

H. III. and IV .- CAVIARE, TREPANG, &c. SWALLOWS' NESTS, &c.

Russian caviare of the very finest quality is exhibited by Nikita Vskyolopowitch Vsivolosiky (338, p. 1382). It receives Honograble Mention.

^{*} These exhibitors were awarded a Prize Medal by the Jury of Class XXIX., in whose list their names appear.

mer, or sen-sing;, in considerable abundance; and magnificent specimens are exhibited in the Chinese Department by H. Hanneron Lindsay (11, p. 1422).

Swallows' nests, used extensively for some by the Chiuese and natives of the Eastern Archipelago, are exhibited of very high quality, by H. H. Landsav (11, p. 1422), in the Chinese Department, together with an excellent model of the made of attachment to the sea-cliffs, adopted by the birds for their nests. The material used is believed to be a sea-weed, resembling in form and substance the Carrageen moss of the Irish seas, which becomes glutinous when thrown up on the beach and decomposing: a peculiar fluid secreted by the swallow aids in the process of constructing the nest. Borneo and Ceylon supply inferior nests, and Java some of good quality

Malacen, Singapore, and Macassar, all send agar-agar, a very similar natural production to that from which the swallows' nests are formed, and employed for the same

ew Zealand, Manilla, and Malacca soud sharks' fine. which are another favourite article of food with the Chinese

H. V .- HONEY.

There is a considerable variety of specimens of honey, both in the comb and run; also of bives, simple and co pliented, for practical or scientific purposes, but no novelty of importance. Among 38 hives exhibited, none preof importance. Auong 38 bives exhibited, none pre-sent any practical improvement. Coly one, which dates apwards of two centuries ago, is really adapted to the requirements of the bees. To this the depriving system (which deprives the bees of a portion of their honey, with-out destroying them) was nadded a century later. Mineb ingenity has since been expended, chiefly in complicatlog hives with various contrivances for ventilation, &c., in no instance producing a return correspondent to the increased expenditure, the chief result being a hindrance to the extension of bee culture.

Butroot. - Among many bives and exhibitors, one alone has been selected as worthy of a Prize Medal; viz., J. M11-TON (Cl. IX., 291, p. 402), who sends an improved entrage hive, with single glass and cover. Simplicity and adapt-ation to practical purposes are here the objects aimed at; the hive is ebeap and available for all classes. Mr. Mil. Tox also exhibits bees well managed and working profitably in a "mansion of industry," a leaf-hive, on Hubert's plan, for scientific investigation;—of merit, for its correct proportion and adaptation to the purposes required; also beautiful honey,

Of the various samples of honeycomb, that of W. C. Of the various samples of honeycomb, that of W. C. Ktrichtenka, Newmarket (Cl. III., 5, p. 2011, bus been selected as of great superiority, that in the upright ghash being perfect in every point. The glass of honey in con-exhibited by Miss Mourtnock, is of equal benaty. Both law been rewarded with Honourable Mention. FORTENS and Mason's exhibition of various honeys (55, p. 294) is good and enrican, and well worthy of attention; it is the result of much pains to illustrate this branch of trade. 2. Canana (131, p. 966) exhibits honey, but course,

and of dark colour 3. Burrish Griana.- The produce of a native bee, said to be of easy domestication, is exhibited from Woodland's Plantation (Mahaica River) (124, p. 986). Its qualities appear remarkably good, particularly as to flavour and sweetness, but it has undercone fermentation. honey is the produce of a stingless bee; it is deposited in pouches, from which it is extracted by paneture, after which the bee stups up the orifice and refills the pouch. 4. The Care of Good Hore sends excellent honey (52, p. 952;, fit for the English market, firm, finely granulated,

rather opaque, but of good pale-yellow colour, and delicate flavour. Honourable Mention was made of the exhibitor, J. G. JOUDERT. 5. Tasmanta produces excellent honey; and several samples were forwarded to the Exhibition, but the jars

arrived in a broken state. 6. FRANCE.-Chevalier DE BEAUVOYS (47, p. 1175) exhibits a large series of bee-hives and aplarian apparatus, all manufactured for practical purposes. The workman-

Borneo and Singapore both supply trepang (beche de : ship, generally good, is in parts unequal. Some of the ances are better snited to the climate of France than England. A Prize Medal is awarded for the hive on Huber's plan, well adapted to the climate of France. The same exhibitor sends various boneys and straining

apparates. The artificial honeycomb of M. DANAISVILLE, of Crossy (153, p. 1178), is a clever and apparently new con-trivance, well adapted to the breeding of bees, though perhaps it would be better so if the cells were less deep. It has been rewarded with a Prize Medal,

Honourable Mention is made of a coopered cask of run honey, of the finest quality as to granulation, consistent delicate colour, and fine flavour. It is properly exhibited in bulk (1558, p. 1251), sent by Challoux La-PAGE and Pornoy.

Au equally fire and perhaps higher-flavoured honey, from the Bases Alper, is exhibited by M. Laugten

(1640, p. 1255). 7. Spars.-Much of the honey from this country is admirable; but it is to be regretted that all the samples in the Catalogue are not forthcoming, particularly the Hinojos honey, said to be the chief product of the district, The El Moral virgin-honey (180, p. 1540), exhibited by A. Molina, is excellent, of good colour and granulation, delicate and highly flavoured, and of renarkable sweetness in after-taste. It is rewarded with Honourable Men-

Many of the orange-flower houeys are good, especially those of Gandalajuna, the great orange-flower honey producing district of Spain; but all are injured by trans-

8. PORTURAL.- All the honeys, six samples, are deteiorated by being put in suppered bottles. Hoonorable Meution is made of No. 593 (p. 1314), from J. B. Die

MATTON 9. SARDINIA sends two samples of honey, one sweet, and one bitter It, Switzenland contributes a beebive, next, strong,

and larger than those of English make. It is on the depriving system, consisting of a conical stock-hive, with a cap, and is exhibited by L. Dawraax (7), p. 1271), of whose invention Honourable Mention is made.

11. GERMANY exhibits fair wood-hives, on the started principle, probably well fitted for the climate.

12. Garacs. — A jar of Hymettus honey, from A. Tsir-ZIMBARDS, of Athens (13, p. 1402), deserves Hommrable Mention. The specimens were brought over in the ori-

ginal jars, and part removed into glass Jars, whereby the quality is injured. The Rhodomeli honey, from Carneto, in Euloru, exhibited by the Bission of Euroga (14, p. 1402), also receives Honourable Mention. It is rather more aromatic and pungent than that of Hymettus. 13. AUSTRIA sends honey, and a Carniolian apiary :

neither is remarkable, 14. EGVPT.- Various buocys, in large jars, dirty, of lead colour, and peculiar flavour, and all in a state of fer-

mentation. TURKET.—The honeys are goverally of good colour and favour. Of one sample (2918, p. 1386) Honourable Mention is made: it is of a fine rose flavour, yellow, and semitransparent

16. Tunta exhibits a sample of honey of the Egyptian character, and not fitted for the European market. 17. Russia. A strong straw bive is exhibited.

18. United States. Joseph Hall, Burlington, New Jersey, sends a hive of living bees.

H. VI.-PREPARATIONS OF BLOOD,

The only examples are those of P. Broccuteni (16), who attempts to utilise the untritions principles of the blood of animals killed for food, by reducing it to a concentrated and dried state, for preservation during long periods. The first step is to prepare a liquid, considered innocuous and untiseptic by the exhibitor, by which various bloods are kept fluid and apparently fresh. Samples of these are exhibited Another series of specimens shows the solid parts forming the crassamentum, or clot, is a dried and semierystalline state. These solid constituents, including the gelatine, albumen, and fibrine, are uext produced, combined with small proportions of flour, in the form of light dry masses, like loaves, cakes, or biscuits. Lastly, they are shown combined with sugar, as cakes and bon-bons.

The larger masses, uncombined with sugar, are inolorous, almost flavourless, and may be made the basis of bighly-nutritious soups. They are very uniform in composition, containing half the hitrogen of dried blood, or 44 per cent, of dry flesh, the equivalent of double the nutritive value of ordinary butcher-neat. Both the hull's and calf \$800d gare 65 ger cent of nitrogen, equal to 43

per cent of field-firming principles.

The value of N. Bioccurina's process depends on the power of preserving the results, in an undecomposed state, during lengthened periods, fee, and though the Jary have understood that the preparations have been even, the evidence is not complete; and the condition of some of the specimens of mixed blood and sugar, once in the Exhibition, The uncombined dried calses seem, however, adapted for this purpose, the condition of the condition of

kes and bon-bons.

The larger masses, uncombined with sugar, are in-

the otherwise wasted blood, M. BROCKHERI's experiments describe encourageness and commendation; and the Jury have felt called upon to award him a testimonial of Homourable Mention. H. VII.—ISLOLASS.

Begarded as an allienceury, substance, intiglate has little citizin upon the attention of the Payer, They laws, however, to report near the scenario of the Payer. They have been considered the scenario of the Payer and the scenario of the Payer and the Control of the Control

PRELIMINARY REMARKS.

For the "Raw Materials" from the Vegetable and Animal Kingdoms mankind owes more to the powers and operations of Nature than to the inventions and appliances of Art, and in the series of the various organic products of nlmost every climate which are exposed in view in the "Exhibition of the Works of Industry of All Nations," the "Exhibition of the Works of Industry of All Nations, relative excellence of the objects to be enuspared might be deemed to be due rather to peculiarities of soil and sky than to the individual merits of the Exhibitors,

Almost every vegetable or animal substance may, how-ever, be modified, and, in relation to its utility to man, improved by a change of the circumstances under which it is naturally developed, the modifications being suggested by a patient study of the respective influences of those circumstances upon the useful properties of such

substance. A further improvement may be effected by carefully defeuding the raw material during the progress of its development from all external influences calculated to deteriorate or injuriously affect it.

The value of every organic product in commerce is much influenced by the mode of its collection, or removal from the animal or plant when developed, and by the processes for separating the useless or less valuable parts or heterogenessus matters from the marketable constihas been extended in its application to that section of the Exhibition assigned to the Jury of Class IV., great scope for both chemical and mechanical skill has been afforded in the extraction and preparation of several of the vege-table and animal substances applied "in Manufactures, as Implements, or for Ornaments.

In the examination and comparison of the very name rous and diversified substnaces confided to their judgment, this Jury have been guided and influenced by the consideration of the invention, ingenuity, skill, and industry manifested in the antelioration and perfection of these several substances, and by the degrees in which unfavourable conditions of suil and climate have been thereby overconic: and in deciding on individual merit, they have carefully taken into account the natural facilities which may have favoured, and the untural difficulties which may have opposed, the realization of the desired qualities in the raw produce transmitted for exhibition.

After a preliminary general survey of their field of operations had shown its vast extent and the great prac-tical importance of the objects to be compared, the Jury, having regard, also, to the earnest desire expressed for expedition in their decisions, resolved themselves into two Committees, one for the Vegetable, the other for the Animal Kingdom; reviewing and testing from time to time in general meetings the evidence of the special examinations confided to those Committees. In preparing their Report of the results of these labours, it has been deemed advisable to divide it into corresponding sections, the classification of the subjects in each being made, as far as it was practicable, in accordance with that of the original "Jury Lists;" the chief differences being that original "Jury Lists"; the enter directed seeing, that—
"Destrine" or starch gum, and "Starch" as employed in
manufactures, have been added to the "Gum and Resin"
series, at the recommendation of the Jury of Class JIII,
and that spermaceti, stearine, stearic acid, with the cussideration of the various recognists until section. sideration of the various processes, partly chemical and partly mechanical, employed in the preparation of these substances, have been referred to the Jury of Class XXIX., in relation to the mannfacture of enadles and AAIA, in relation to the mannifeture of candics and other precised applications of these substances, already maker the review of that July Mannifeture (Therein) and the review of that July (Therein) and the request of the July of Class 1. "Allian "extrema ferred to other articles of stationery, the subjects of Class XVIII. Lastly, the subdivision C, including the "Vegetable Acids," such as sectic, citric, trataric, oxalic, and other organic acids employed in the arts being, in almost all cases, the products of distinct chemical operations, have been brought under the consideration of the Jury of Class II. Subject to these changes, therefore, in the list of objects originally assigned to this Class, the present Report will be subdivided, as respects the Vegetable kingdom into eight beads, and as respects the Animal Kingdom into five heads; with a preliminary section explanatory of the grounds on which the awards of the Council Medal have been recommended.

RECOMMENDATIONS FOR THE COUNCIL MEDAL.

Among the numerous samples of Raw Produce contributed by different countries, there are several collections of especial value, which derive additional merit from their completeness, and from the fact that they illustrate

great; and the Jury, therefore, being desirous of express-ing their approbation of the practical benefits to be derived from the formation and study of such collections, and the advantages which the commercial and manufacturing community may obtain by their means, have determined to recommend the award of the Council Medal to the Governments of those countries the natural produce of which were thus so instructively and completely exhibited.

The Jury have, accordingly, recommended the award of a Council Medal* to the Honormania East India COMPANY for the very valuable and important collection of the raw produce of the Indiau empire exhibited by them (pp. 876-878), which illustrates in a remarkable manner the vast and putural resources of that empire, and places before manufacturers a number of valuable new or little known substances, many of which are likely, hereafter, to become considerable articles of import,

The Jury have, on the same grounds, recommended the award of a Council Medal* to the Tructon Government for the very valuable and important collection of the raw produce of the Turkish empire (p. 1386), shown in the Turkish Deportment, and which, from its cateut and completeness, is most interesting and instructive. Both this collection and that of the Hon. East India Company derive odditional value from the fact, that the specimens are not merely picked samples of fine produce, but really represent the average quality of each article; and also from the exhibition of specimens showing the different degrees of goodness, and the comparative superiority or inferiority of the productions of different districts

A Conneil Medal has also been awarded to the Government of Spain* for the valuable and extensive collection of raw products, illustrating the natural resonrees of that

country (pp. 1337, 1338).

The Jury have also recommended the award of a Council Medal* to the French Mixingren or Wan for the very complete and well-arranged collection of Raw Produce of Algeria (p. 1259), remarkable for excellence in many respects, and affording a good example of the progress and improvement of a young colony—in the ame-lioration of the native productions, and in the successful introduction and enltivation of new branches of industri - by the judicious application of practical science to the development of the raw materials used in various manu-

After comparing together the various American cotton, and contrasting them with those of admiration of the nurivalled excellence of the long-staple cottons of the United Stotes, depending not merely on the length, strength, and silky fineness of the fibre, but being also due to the improved modes of culture, cleaning, and packing—the results of long experience and repeated efforts. The Jury found it quite impossible to decide between the minute slades of difference of the individual bales of cotton; besides which they considered that the merit was due not to any one exhibitor, but rather to the cotton-planters of America generally: they, therefore, recommended the award of a Council Medal* TO THE GOVERNMENT OF THE UNITED STATES for the excellent samples of long-staple cotton shown, which exhibit such marked and superior excellence as to leave hardly any further improvement to be desired (p. 1431). On the same grounds the Jory were desirous of testi-

fying their sense of the peculiar value and excellence of the felting wools (p. 1005), adapted to the manufacture of the finest kinds of cloth, which are exhibited in the Austrian Department, by recommending the transmission of a Council Medal* TO THE GUVERNMENT OF THAT And with regard to the superior quality of the raw ailks shown in the French Department, the Jury, by their recommendation of the award of the Conneil Medal* to the "Central Society of Sericiculture of France,

* Owing to technical objections, these Council Medals were not passed by the Council of Chairmen.

the trade and manufactures of an entire country. The have desired to testify their admiration of the specimens importonce of such collections, not only in a coromercial, exhibited by many members of that Society, and their but in a statistical and scientific point of view, is very appreciation of the importon influence which it has eaereised in the improvement of this beautiful and valuable product of the animal kinedom.

Two other collections, though not quite analogous to these, were, for similar reasons, deemed worthy by the Jury of the highest commendation, and have been ac cordingly recommended for the award of the Council Medal; namely, the collection of Messrs, Lawson of Ediuhurgh, and the series of Liverpool Imports. The former consists of a most complete and well-arranged collection of the vegetable productions of Scotland, value of the whole mainly depending on the excellent systematic summer in which the specimens are arranged and classified; the careful and accurate information which accompanies the different samples; the manner in which the practical uses of each raw product are shown and illustrated; and the valuable catalogues which have been drawn up by Messrs, Lawson,

The LIVERPOOL COLLECTION OF IMPORTS Class XXIX... p. 803), though it does not of course represent either the exports or the imports of any individual country, is nevertheless, owing to the extensive trade of that port, and the large number of imports which it includes, a fair repre-sentation of a very large portion of the commerce of the country: like the preceding collection of Messrs, Lawson, it derives much of its practical value from its son, it derives much of its practical value from its arrangement, and from the useful information which accompanies each specimen. Much valuable knowledge, which no book can give, is to be obtained from the attentive study of this collection, as the different pro-ductions of various countries are, in it, placed side by side, with a memorandum appended to each, showing the quantity of it imported into Liverpool during the last ten 1 core

The Jory also recommended the award of a Council Medal to the 'Royal Society for the Improvement of the Cultivation of Flax in Ireland' (p. 203*), for their persevering and successful efforts to improve the growth and preparation of flax in the British empire. The Jut believe that the rapid and progressive advance which during the last dozen years, has been made in the cultivation of flax in Ireland, is mainly, if not entirely, due to the exertions and influence of this valuable institution.

In the class of vegetable raw produce, the following subject was found to be of sufficient importance, in the opinion of the Jury, to merit special commendation, namely, Mexcen's Process for Medifying the Fibre of Cottoo (Class XVIII., 48, p. 56); this was considered so valuable and so important a discovery that the Jury determined to recommend it as worthy of the distinction of a Council Medal. The process, itself, consists principally in steeping cotton in a dilute solution of caustio sods, the effect of which is, to after the physical and chemical properties of the fibre in a very remarkable manner, causing each single fibre to reassume, to some extent, its original character old microscopic appearance exchanging the ribbon-like or tlattened appearance which cotton ordinarily presents, for one of a more or less dis-tinetly cyliodrical character. The shrinking of the fibre which is thus caused, whilst it produces a most remarkable difference in the appearance of all woven fabrics, does not at all decrease its strength, but, on the contrary, renders it even stronger. At the same time that these physical alterations are produced, the chemical oature of the cotton is likewise modified, and its relation to colouring matter and mordants is changed in an equally remarkable manner; the prepared cotton taking the dyes more easily ond fir more perfectly than that which has not heen prepared, so that the colour dyed in the same vat is Among the vegetable charcoals which this Jury were quested to examine and report upon, they found worthy of special notice the following series, exhibited in France.

Class III., lo whose Award List it is inserted.

^{*} Owing to technical objections, this Council Medal was not passed by the Council of Chairmen.

+ This Medal was given conjointly with the Jury of

No. 1404, by M. POPPLIN DCCARRE (p. 1243); vis., specimens of prepared charcoal in cylindrical masses, called 'charbon de Pariss' specimens of carbonized twigs and small branches of trees and of carbonized tan, accompanied with models of the machinery employed in

the manufacture of the prepared charcoal. The first merit of the ingratious invention here illustrated, and that which renders it of special importance in countries dependent on wood for feel, is the modification of the ovens for carbonizing, without incineration, those small ligaeous portions of plants and shrubs which had previously been of no value in the formation of charcoal, and were regarded as the waste of the forest; this mode of carbonization is equally applicable to underwood, furzebushes, cane-brake, and even to the refuse tan of many manufactures. The charcoal thus produced, together with the dust from ordinary charcoal magazines, is then converted into a kind of artificial coke, in a manoer analogous to that by which coal-dust has been for many years past converted into similar fuel in Eugland. The produce of the ovens in M. Popelin Ducarre's extensive works is pulverized, mixed with a certain proportion of coal-tar or gas-tar (gondron de honille), and monided into small cylinders, which are a second time submitted to carbonization. The machinery effecting these purposes is remarkable for its ingenuity and efficiency; and the result is a regular, solid, hard, heavy, but porous the result is a regular, solid, mard, neavy, but porous charcoal-coke, which is used with economy and success, as is amply testified by the Reports of the "Central Jury" of the Exposition at Paris in 1849, of the "Society of Encouragement," and of the "Central Society of Agri culture," of France, and by the written testimonials of many eminent manufacturers in France, requiring large quantities of an economical fuel. The "charbon de Paris" is peculiarly adapted for those manufactures in which a low and long-sustained heat is required to be maintained, and it is sold at a rate one-fourth cheaper than ordinary charcoal.

The Jury, appreciating the value of this invention of the ingenious Exhibitor, especially to countries which, like France, are not abundantly supplied with coal, have recommended the award of the Council Medal to M. POPELIN DECABLE.

Amongst the series of wools shown in the French Department are specimens characterised by a well-skilled English Expert as "a wool of singular and peculiar properties—the hair glossy and silky, similar to mobalr, retaining at the same time certain prosperties of the merinhred." This woul is exhibited under No. 245 (p. 1185), the distribution of the produce of a peculiar variety of the merino bered of sheep.

The Jary cotered icto an inquiry, not only into the commercial rales and application, but into the particulars of the production of this new kind of wool, and finding it to be one of the very few instances is which the origination of a distinct variety of a domestic quadruped can be satisfactorly traced, with althe circumstances attending its development well authenticated, a brief statement of these has been deemed appropriate in the present

Reporting year 1828, near of the crew of the flow, of mericons in the form of Machanian produced a run which became remarkable for the long, amouth, straight, and the like years are sufficiently observed as the flow of the work, and for the season of the control of the contro

long neck, narrow chest, and long flanks of the abnormal ogenitor, whilst others combined the ordinary and better-formed body with the fine silky wool. M. Graux, profiting by this partial resumption of the normal type of the merino in certain of the descendants of the malformed original variety, at length succeeded, by a judicious system of crossing and interpreeding, in obtaining a flock combining the long fine sitky fleece with a smaller head, shorter neck, broader flanks, and more capacinus chest. Of this breed the flocks have become sufficiently chest. Of this breed the flocks have become safficiently numerous to eable the peoprietor to sell examples of the hreed for exportation. The crossing of the Manchamp variety with the ordinary merino has also produced a valuable quality of wool, known in France as the "Manchamp-neeriso." The fine sikly wool of the pure Manchamp breed is remarkable for its qualities as comb ing-wool, owing to the strength as well as the length and fincuess of the fibre. It is found of great value by the manufacturers of Cachemere shawls, being second only to the true Cachemere ficece in the fine flexible delicacy of the fabric, and is of particular utility, when combined with the Cachemere wool, in imparting to the manufacture qualities of strength and consistence in which the pure Cachemere is deficient.

Although the quantity of the wool yielded by the Mauchamp variety is less than that given by the ordinary merinos, the higher price which it obtains in the Prench markets (25 per cent. above the best meriae wools*), and the present value of the hered have fully compensated M. Graux for the pains and care which he has manifested in the establishment of the Mauchamp variety.

The Jury, considering the quality of invention which has been superabled to the skill and industry requisite for obtaining the finer qualities of wool under any circamatances, in the development of the new variety of sheep yielding the specimens exhibited in No. 245, have recommended that the Conneil Medal be awarded to J. L. GRACK.

The most remarkable progress in the economical extmetion and preparation of pure gelatines and glues from the waste remnants of the skins, bones, tendons, ligaments, and other gelatinous tissues of animals, has been made in France, where the well-organised and admirablyarranged establishments for the slaughter of cattle, she and horses in large towns, give great and valuable facili-ties for the economical applications of all the waste parts of animal bodies. Among the beautiful productions of this industry, the specimens exhibited by its chief origipeculiar approbation. They include different kinds of gelatine is this layers, adapted for the dressing of stuffs, and for gelatinous baths, in the clarification of wines which contain a sufficient quantity of tannia to precipitate the gelatine; pure and white gelatines cut into threads for the use of the confectioner; very thin white and transparent sheets called papier glace or ice paper, for copying drawings; and finally, a quantity of objects of luxury or armaments formed of dyed, silvered, or gilt gelatines, adapted to a variety of purposes, and to the fabrication of artificial or fancy flowers. M. Grenet, narication of artificial or faircy flowers. M. Great who was the first to fabricate on a brige scale, out of various residues of animal bodies of little value, these beautiful and diversified products, many of which had previously been derived from singlass, has been deemed by the Jury to meet a special antice in the by the Jury to merit special notice in the present section of the Report, and they have recommended to him the award of the Council Medal.

A considerable number of collections of my preduce from various countries are exhibited, each including a number of different specimens, many of which, taken singly or in groups, are of importance, either from their norely, their superior excellence, or the locality from which they are sent; the Jury considered it most navisament of the properties of the properties of the contraction of the properties of the properties of the following collections respectively; --

According to the able Report of M. A. Yvart, Inspector of the Veterinary Schools and National Sheepfold of France, p. 42. To Hon, Lieut-Colonel Buttrawonth, Governor of Prince of Wales' Island and Singapore, for a collection of raw produce from Singapore and the Straits (876-890). To Major F. Jeskiss, Chairman of the Assan Committee, for the collection of the raw produce of

Assam.

W. B. P. Wood, for a collection of the raw produce of Western Australia (988).
To Sid Manno'n Benyad of Tunis, Commissioner

for the Government of Tunis, for a collection of the raw produce of that country (1412).

To Anura Havin of Alexandria, Commissioner for

the Government of Egypt, for a collection of the raw produce of that country (1408).

To the President of the Maryland Committee.

for a collection of specimens of the principal raw produce of that state (U. S. 371, p. 1459). To the Admiculturenal Board of Valencia, for the collection of raw produce (173, 209, pp. 1339 & 1342).

To the Academica List, 205, pp. 1939 to 1928.

To the Academica Holan or Saracossa for the collection of raw produce (148, pp. 1937, 1938

To Sir Roman Schommung, H. M. Consul to the Dominican Republic, for specimens of the raw produce of

that republic (1428).
To the Royal Technological Institute of Tuscant, for the collection of the raw produce of that country (47, p. 1294).

PART I.—VEGETABLE KINGDOM. From the fact that the Exhibition is the first attempt to

bring together a complete collection of the natural raw produce of all parts of the globe, and from the very different views which were entertained in various countries as to the nature of the Exhibition, and the kind of substances which it was desirable to collect and exhibit, it necessarily follows that the collection, viewed as a whole, is very incomplete. In some cases, abundant and numerous specimens have been sent of all the various kinds of raw produce, constituting the staple productions of the country, their value and importance having been evidently felt and neknowledged; whilst, in other instances, it is apparent that the mere raw materials of any manufacture have been regarded as of comparatively little importance, and are consequently either not shown at all, or else are but imperfectly and inadequately exhihited, in the form of small or inferior samples. This cirenmstance, whilst, on the one hand, it has perhaps somewhat diminished the labour of the Jury, has, at the same time, rendered their task even more difficult than it would have been had the entire collection been more uniform and complete. It is therefore necessary to bear in mind, that as the duty of the Jury was only to consider and decide on the individual merits of the different specimens exhibited, so it necessarily happens that in some cases they have to report,—as being the best sample shown,—a specimen of second-rate quality, and one, even, decidedly inferior to what is often met with in commerce as an import from some other country, specimens of which,

however, do not happen to be shown in the Exhibition. Every substance was examined carefully sud considered separately; and in awarding a prize, it was only compared with substances of a similar nature. It is, of course, evident, that the award of a medal to two different things does not infer that they are of equal merit or importance; but, merely, that each taken separately, and mon its own merits alone, was found worthy of high commendation and approval. It is also right to observe, that as the value of any sample of raw produce does not rest merely on its own intrinsic superiority, but depends on a number of different circum-stances, which may modify its value; so, even a secondrate sample, either from a new locality, or prepared by a new and more advantageous method, may have more real merit, and be more fully entitled to favourable mention, than a superior sample possessing no peculiar novelty, and deriving its excellence rather from accident than from either the skill or the ingennity of the producers. These remarks apply to all the classes of subjects brought under the consideration of the Jury; but in no instance do they apply more strongly than in the case of gums and resins

"Com," properly so called, it mod in large quantities for a number of purposes in the arts: it is presently disformed to the property of the property of the company of t

common turpeutine, are used as sources of the volatile oils. Gum resins are chiefly used in medicine. The total quantity of "gum" imported into England in 1848 and 1849, as shown by the Custom-house returns, was,—

Arabic 24	eta, Cuta. .092 33.136
	404 6,577
Copel and anime (resins) - 2	958 4,315
Tragacanth	234 314
Total St	,618 44,342

The largest import of gum, therefore, is of Arabic, and under this head a considerable variety is probably included; the countries from which the 33,136 cwts. were imported in 1849, are as follows:--

The East	Indi	e)n	Emp	te	-	-	13,687	
Egypt	-	-	-	-	-	-	6,232	
Moroeco	-	-	-	-	-	-	6,064

Miscellan	cours	-	-	-	-	-	172	
	Tes	tet		_	_	_	33 135	

Of the resins and oleo-resins, the most important are trippetitive and lac. Of the former, 412,042 evts, were imported in 1849, nearly the whole of which was brought from the United States. The quantity of fac imported in 1849 was 14,786 ewts.; of this, 14,556 ewts, were the produce of the East Indian empire.

la the collection of imports, exhibited by the Hell. COMMITTEE, there are samples of common turpentine and of rosin from the United States; of the former, about 30,000 harrels, and of the latter, about 2,000 harrels are annually imported into Hall. Tarpentine is separated by distillation into oil or spirit of turpentine, sometimes called camphine, and resin or colophony. In its raw state

tarpentine is of very little use; it is chiefly important as yielding those substances. The collection of gams and resins exhibited by the East India Company (pp. 376, 377) is very extensive and interesting, and forms an important division of the great collection of the raw produce of the Indian empire, für which the Jury have recommended the award of a Council Medal. The series is so numerous, and many of the substances which it contains are so little known in Europe, that it would hardly be possible, at present, to give any detailed report on the individual samples. In the following remarks, therefore, only a few of the more striking substances are noticed, whilst a great number of substances are necessarily reserved for fature study and investigation. Even a slight examination of the natural raw produce of India shows the immense resources of the country; and when we remember the varied and abundant productions which may be had in almost unlimited quantities, and at very little more trouble than the mere cost of collection (for in such a soil and climate nature needs but little artificial aid), it is not saying too much to assert that no portion of the globe is more highly favoured by nature, or more able to supply those substances which minister to the wants and luxuries of mankind. With a fertile soil and a generous climate, vegetation of all sorts is rapid and luxuriant; and as labour is cheap and abundant, everything seems most favourable to agriculture and the growth of all vegetable products. There are, however, several great obstacles which have ever retarded the increasing prosperity of India, and which present the most serious difficulties in the way of its commercial development; especially the inert, care-less, and indifferent habits of the natives, confirmed and kept up by religious peculiarities and long-established prejudices. Not only are the natives of India wholly ignorant of the value of many of the natural productions of the empire, and therefore quite indifferent to their very existence, but at the some time, also, the manufac-turers of Enrope being anacquainted with many of these substances, or being ignorant that they may be had in almost unlimited quantities from our eastern possessions, do not avail themselves of the advantages which are in fact within their reach. Many of the natural productions of India will unquestionably become important articles of trade to this country, when their vaine is better known; and this result, whilst advantageous to our own country, will, at the same time greatly benefit India, and will lead to the construction of good roads, or other modes of transit, by means of which, internal traffic,

and the speedy, cheap, and safe carriage of merchan-dize may be effected. The continued and persevering efforts of European skill and capital, will no doubt in time, to a great extent, remove or diminish these obstacles; but, in the mean time, the evil effect which they produce on the natural advantages of the Indian empire is enormous.

Among the East Indian resins there are some interesting specimens of lac; the sample of shell-hie in large, thin orange sheets is of very superior excellence, and is altogether far alove any met with in commerce.

The specimens of lac from Singapore, which is stated

to be abundant in the jurgles of the Peninsula, but has not hitherto been collected as an article of commerce, though not first-rate, are still highly commendable, and worthy of encouragement. The Jury deem them de-serving of Honourable Me, ion,

Good samples of lac are also contributed from Bombay : from Ganiam, by A. P. Onslow: by G. G. Nicol, from Siam; from Nepal, by His Highness the Managart of Name: from Nepas, ny 1110 Higginges the Namanasan on NEFAL: from Beerthloom, specimens of the two varieties called bain and chanch; and from the Rajpootana States, samples of bur-lar, or lee produced on the Fiew indica, also lae from the Fiew religious, Ziegphus jujuba, and the Acacia concinna or Mimosa abstergens. An interesting series of samples from Assam, illustrating the formation, collection, and ases of lac, is contributed by Dr. C. HUFF-NAOLE. For this series, together with several other small collections of raw produce shown in illustration of the native manufactures of India, the Jury awarded a

Prize Medal to Dr. Huffungle.

The samples of gutta percha from Johore, Malay penin-sula, contributed by W. Kern, of Singapore, together with the illustrations of the native modes of working the substance, and the purposes to which it is applied, are interesting and important. It is to be regretted that the same careless and wasteful mode of collecting this valuable substance, is, for the most part, still employed, as was originally the case when it was first introduced into Euoriginative the case when it was first introduced into Eu-rope eight years since by Dr. Moutgonerie, of Singa-pore; namely, recklessly earting down the large trees for the sake of a few pounds of the substance; from this, it naturally follows that the tree gradually becomes less abundant, and, consequently, ere long the price of the substantial control of the price of the substantial price o article will probably increase so much as to preclade it altogether from being used for many purposes. The Jary awarded a Prize Medal for this series. Some of the first samples of gutta percha (Isowandra gutta), sent over to the East India Company by Dr. Montgomeric, and for the introduction of which he received the Gold Medal of the Society for the Encouragement of Arts and Manufactures, in 1843, are exhibited by Col. Bonner of the East India House.

The specimen of gutta trap from Singapore, a sub-stance evidently allied to gutta percha and caoutchone, and employed there in the manufacture of bird-line, is

interesting. It is stated to be the inspinanted juice of an Astecarpus; and it is highly peculiade that there are a number of similar veperation productions, such as the analysis of the productions, such as the different productions, such as the different production of the producti

The samples of caoutelone or India-rubber are of considerable interest: those from Sumatra and Java, in particular, are deserving of notice. A considerable unmber of specimens of enoutehoue from different localities, and prepared in different manners, is shown by Dr. ROYLE (p. 869), including samples of India-rubber, obtained from the Ficus elawica in Assam by Captain Veitch, and some prepared by Dr. Scott; and a portion of the wood and juice of the Urccelo elastica, from Singapore, is contributed by W. BROCKEDON, as well as a vonug plant of the Ficus elastica. A good series of samples of the different forms of India rabber, commonly known in commerce, is also exhibited by Messrs. Mackistoni, in commerce, it must extinute a by Mesers. MANNISTON, in-illustration of the various useful und beautiful applica-tions which are made of it in the arts. Many of the specimens of East Iodian caoutehooe, however, show that unfurtunate "tackiness" which so greatly dimi-nishes the value of some forms of Iudia-rubber. The samples from Assam, in particular, illustrate the great importance of care and attention in the preparation of enoutchone: the specimens sent over some years since by Captain Veitch are of excellent quality, and bave not undergone any chaoge since they have been in England. They were evidently formed from many successive layers of sup, each layer being allowed to dry before a fresh one was applied. On the other hand, many of the more recent specimens are sticky and in a partially decompos-ing state. These bave plainly been formed by the congulation of a considerable hulk of the sap rapidly collected; a little time and attention have thus been saved, but at the sacrifice of the most useful properties of the caoutehoue. All samples of Iudiu-rubber from new localities, where

there is any poolsability of a large quantity being obtioned, are valuable. One specimen, purpristed attration, and the speciment of the speciment of the time dependency of the speciment of the specimens, as the specimens, as a specimen of the specimens of the manufacture of the specimens of the specimens of the specimens of likelyshey. In the following list the chief Indian gums and resins, &c., are necessarily placed under one common head, as, without a minute examination, it would not be possible to class them more accurately.

Babool gam, gond babool, &c., obtained from the Acaria arabica, or babool tree; an inferiur sort of gumanabic from Bengal.
 Cattie gam, a variety of the babool gam, largely.

 Gattie gum, a variety of the babool gum, largely produced in the Decena, Coucan, and Gusreat; well known in commerce as East Indian gum-arabe; u specimen is also contributed from Bombay.
 Kheir gum, the produce of Acucia catechy.

closely resembling the preceding; from the Rajpootana

 Jumma jegota (Acacia leucophlara); from Vizagnpatam.

 Keekur gond, babool tree (1 arhellia farmesiana); from Bengal; both closely resembling the babool gum, and consequently varieties of arabic.

 Wood-apple gum, obtained from the wood-apple, or Feronia elephantien; from Vizagapatam; a good and useful gum.

7. Margosa gam, from the margosa tree (Melia azadirachta); from Madura, Tinnevelly, and Palameottah; inferior. 8. Mallaga jegota, from the Moringa pterggosperma;

from Vizagapatam.
9. Pagada jegoto (Mimuopa eleagi); from Vizaga-

 Tanjada jegota (Cassia anriculata); from Vizagapatam. These three appear likewise to be suft, with difficultly soluble, and inferior gams.
 Ballee gond, or spurious tragacaath, obtained from

the Streedia urras; sent from Bombay.

12. Kutecra (Cochlospermon goasypium), like the preceding, a sort of inferior tragacauth; contributed from

13. Vatoria reain, an excellent reain obtained from the Fateria indica, from which it exudes as a halam in a semi-fluid state, constituting the peynic variabit; it soon becomes hard when exposed to the sir. This resin is shown both in the fluid state and also when solidified:

from Malabar and Canara.

14. Dhoon, or Saul dammar, a good resin ahandantly obtained from the soul tree (Shorae robusta), common in the northern parts of Hindostan; contributed by his Highness the Manaadan of Nepat, and from Bengal and Blagatlpore, in the Moorshedshold district.

 Soundroos, or copal; imported from Africa through Arabia, and often called anime. 16, Guggilam (Vatica tembugaia); from Canara and imgapatam (p. 876). 17. Tendoo resia (Diospyros sp.); from the Raipootana

CLOSS IV.1

- 18. Gaup resin, obtained from the Gaup tree (Embry-
- opteris glatinifera); from Ilhagulpore. 19. Mekae-sta Dittoona, or Kerela resia; from Assam. 20, Odina resin, a resinous substance obtained from the Oding Wodier; from Calcutta and from Meerut 21. Narceda jegota (Eugenis jambolana); from Viza-
- 22. Olibanum, saleh gond, Lobaa (Bouvellia thurifera); from Chota Nagpore, and Patna 23, Cumbi resta, or Dikamali (Gardenia Iscida): from
- Rombay. 24. Dammar (Dammara orientalis); from Malacca, Java, Sumatra, and Borneo.
- 25. Jiliadi pulu (Culotropis gigantes); from Vizagapatam.
- 26, Ammoniaeum; imported from Arabia. 27. Assafatisla (Narthax assafertida); imported from Persia and Siadh.
- 28. Bdellium (Ameris comminhera, Balsamodendron Anglocky). Of this two or three varieties are exhibited : the solid gum resin, and an eleo-resin or balsam, said to be obtained from the same tree; the former in frequently met with in commerce, being falsely called "myrrh,
- and sometimes under the name of " galbanum. 29. Myrrh; imported from Africa through Ambia, &c. 30. Dragou's-blood; imported from Aden, also from
- 31. Gamboge; from Singapore, Mysore, Canara, &c. 32. Camboley (Merus indica); from Paulghat.
- 34. Manndi jegotn (Mangifera indica) 35. Dadinin jegota (Punica grasatum); from Vizaga-
- 36. Benzoin (Styrax benzoin): from Sumatra; specimens of a similar resin, also called benzoin, are contributed from Malabar and Canara. 37. Storax; from Rajpootana states
- 38. Turpentine (Pinne Khanyana); from Churra Poonice, in the Dacca division, and from Ullwar,

- 39. Moochrus (Bombax heptaphylla), a gum; from Calentta hoznars.
 - 41. Manjegota (Fiers indice): from Vizagapatam, Atti jegota (Fiena racemosa); from Vizagaputano.
 Nepalapi pulu (Jatropha curems); from Vizaga-
- patam and Ganjam. 44. Coorg resin, a pale green and very excellent resin; from Coorg, contributed by His Highaess the RAJAH of TRAVANCORE. It seems to deserve further inquiry and
- examination, as it might probably be well adapted for varuishes, &c. Besides these, a very considerable aumber of other
- Indian retins, gums, and gum resins, is included in Dr. Royle's extensive enlection of the raw produce of ladia; amongst these are many of the preceding ones, and also the following: -
 - 45. Galbanum; from Surat. 46. Cherry gum (Prense puddum); from Surat
- 47. Sem ke gond, or gota gond (Bashisia Fahlii); from Devra and Ilajpore. 48. Labdanum, or ladun (Cistus ladeniferus); from
- Surat. 49. Mastie, or mustagee (Pistacia Iratiscus); from Caubul
- 50. Scammony, or sukmoonyn (Cenvolvulus scammonia): from Surut. 51, Knauee gond, or jiagun ke gond (Icica resinifera);
- from the Khera Pass 52. Toon ke gond (Cedrela toona).

53. Sohunjae ke gnud (Morison ptergosp According to Mr. Thomas, the "gum" o " of Coimbatore is a mixture of various gums and resins: he mentions twenty-fuur different plants, the natural exadations of which are collected; and be observes that they are said to be nearly all collected promisenously, and sold in the aggregate as gum—the mass being, of course, very impure; but that, when dissolved in a large quantity of water, and straiged through a fine cloth, it yields a solu-tion from which a good and very adhesive gum may be ultained by evaporation. The plants from which these various substances thus associated together are collected, are, according to Dr. Wight-

From this list it is evident how much the value of the good gum must be deteriorated by the inferior gums and resinous matter mixed with it : a little care in the collection, only the better sorts being chosen, would be amply repaid by the increased value of the article.

The very remarkable wood-oils and native varaishes of

India, obtained from various species of Diptercarpes, beisng properly to the "resin" series, and may therefore be mentioned here in connexion with the balsams and alco-resits. These eurious substances, though fluid

when first obtained, soon harden and solidify (p. 876); they constitute the basis of the best Burmese and other eustern varuishes and lacquers. Specimens of the Thetsee, Melanorrhaa multatissima, employed as a lacquer, from Arracan; of the Themakthn, also used in Arracan, in the manufacture of papier-mache work, and in rendering umbrellas water-proof; and of the Garjua, or wood-oil, from various Dipterocurpi, from Madura, Tinnevells, Chittagong, Pegu, and Mahurmanee, are shown. The or varnish-tree of the llurmese, is spread Theet-see,

over a wide runge of country attending from Naniper (Le 2) N, long of 19th, 10 Tarvey (at 18 N, long, 10 th, 20 N, long) and the N N, long, 10 th, 20 N, long of 19th, 10 Tarvey (at 18 N, long, 10 th, 20 N, long of 19th, 20 N, lo

straight stem of more than 40 feet to the first branch, and a circumference of 13 feet and upwards.

Samples of the empyreumatic oil of teal-wood are contributed by W. P. Houstaw, from Palameottab. Two remarkable oils, apparently analogous to the wood-uils, are contributed from Coorg, but without any information; one of these, a thick blood-red oil, is stated to be ob-

tained from the Bettlern incertain.

Interesting specimens of the "Galanish" or engleInteresting specimens of the "Galanish" or engleInteresting specimens of the "Galanish" or englehighly electured in the East as a perfinne or incense, are
shown in the Bast as a perfinne or incense, are

bleasing."
T. B. Dicours (49, p. 980) exhibits a fine sample of anime, said to be abundantly produced by the simiri, or locust-tree, on the river Berbice: this was deemed worthy of Honourable Mention.
A specimen of Hawai gam, a variety of frankincense.

J. S. Sturenmar (46, pp. 979, 980). Fine specimens of anime from the locust-tree (Hymenou corrierit), from Arima (p. 973), and also of incense (Trichila trisitesis), are shown in the collection of raw produce of Trinidad, southly his Excellency Loan Harnis,

the Governor (see p. 71).

Several good specimens of recin and guars are shown in the Australian and Van Dienere's Land cellections in the Australian and Van Dienere's Land cellections, including the guars of the black and after wards, don't all carries and the contract of the Carrier of the contract of the contract of the contract of the Carrier of the contract of the contr

The resums shown by J. Millican, of Flinders' Island, Bass's Straits, including specimens of the "Black-boy gmm" (Xauthorhea resin, 81, p. 994); the foe pale resin of the Oyster-bay pine (Callitris Australis), from the eastern coast of Van Diemen's Land, and the Acada sucrosata gum, also from Flinders' Island (234, p. 997), were likewise deemed worthy of Honograph Mention.

A fine sample of Kauri, or cowrec copal, the produce of Danmera Asstralia, a very beautiful resis from New Zealand, exhibited by W. Baown (16, p. 1001), was deemed worthy, by the Jarry, of a Prize Medal. It is stated that this resis may be obtained, in any quantity, in the northern parts of New Zealand, ranging from 20 milet worth of Airckhaul to the North Cape. A small sample of worthy of Honoumble Mettion.

Some excellent specimens of lae, benjamin, dammer, gutta percha, and caontchour, &c., from the Eastern Archipelago, are exhibited by Messrs. W. P. HAMNON and Co. (p. 988), in the collection of raw produce, for which a Price Medal has been nwarded by the Jury (see p. 71).

Dr. FERCHTWANDER, of New York (469, pp. 1464, 1465), has shown a very excellent specimen of bleached shell lac. This was deemed deserving of Hononrable Mention.

In the Mexican collection is a sample of a remarkable orange-colonred resin, called Pipitzahuae, but of which no particulars are given.

The Egyptian collection of raw produce, for which, as a whole, a Prize Medal has been awarded by the Jury (see p. 71), contains some good specimeus of gum (120, 121, p. 1409). The selected gum of Seunaar is of excellent quality, and was deemed worthy of Honourable Mention. The purified turpentine shows by J. F. Egyra's, of Bor-

deaux (214, p. 1184), prepared by a patent process, was found to be excellent, and therefore deemed worthy of Hosourable Mention.

A fine sample of copal, from Angola, shown in the Portuguese collection by F. R. Batalha (458, p. 1313),

rortuguese consection by F. R. BATALRA (498, p. 1313), was also deemed worthy of Honourable Meution.

An excellent series of specimens of turpentine, and of the resine and volatile oil obtained from it by distillation, is shown by Froms, Caldesson, & Co., of Barros (241).

grants Google

It was deemed deserving of Honourable British gam. In February, 1842, Mr. Colman took ont 1314). In the Turkish collection, very good samples of the ordinary guans and resins for commerce are shown, in-cluding the following:

he following:				
1. Gum-aral	bic -	-	-	Egypt.
2	-	-	-	Tripoli,
3. Gum-tras	cacanth	-	-	Damascus.

The samples of arabie and of mastic are excellent, is stated that the resin from Anatolia is used for making the handles of knives, and for similar purposes.

STARCH SERIES.

In examining the starch series, or rather the starch and starch-gum or dextrine series, the Jury have only taken notice of those substances prepared especially for manufacturing purposes, or which they conceived might be advantageously employed by manufacturers. have altogether passed over those forms of starch and form intended, specifically, as articles of food, or which, from their cost or the mode in which they were prepared.

would not be suitable for the former purposes.

The specimens of starch from rice, exhibited by Messrs. ORLANDO JONES & Co. (Class III., 128, p. 208, are remarkably good. Rice contains, on an average, about 84 per cent- of starch; but, till comparatively a few years ago, no starch was manufactured from it, notwith-standing its low price and the large quantity of starch which exists in it. The reason of this was, that the old process of fermentation, by means of which starch is proenred from grain, was not found to be applicable to rice; and hence the latter only became available as a source of starch in 1840, when Mr. O. Jones introduced his new process, for which be obtained a patent. This process consisted in macerating the rice for about 20 hours in a dilute solution of caustic potash, coataining about 200 grains of the atkali in every gallon; the liquor is then drawn off, the rice dried, reduced to powder by grindiag, then a second time digested in a similar atkaline lye for 24 hours, repeatedly agitated: after this it is allowed to settle, and well washed with pure cold water. The Jury awarded a Prize Medal to Mr. O. Jones for his rice

Mr. S. Berger (Class III., 130, p. 268), of Bromley, Mr. S. Benoux (Class III., 130, p. 208), of Bremiley, also exhibits starch prepared from rice, which is of similar excellence, though said to be prepared in a different manner. It place of employing a dilute colution of caustic potash to dissolve the "gluten" and other insoluble matters of the grain, Mr. Berger ness n solution of carbonate of soda, containing half-a-possed to the gallon The rice is steeped in cold water for 48 hours; levigated in a suitable mill; and the pulp thus formed is treated with the solution of carbonate of soda for 60 or 70 hours. being repeatedly stirred: it is then allowed to settle for some hours, the alkaline liquor is drawn off, and the starch is washed and purified. This process was patented by Mr. Berger in December 1841. The Jury awarded a Prize Medal to Mr. Berger for his rice starch

A third series of samples of rice starch, also prepared y a different process, is exhibited by Mesers. J. and J. Colman (Class III., 117, p. 207), who also show good specimens of ordinary wheat starch, and dextrine or

a patent for the manufacture of starch from rice, by the action of dilute muriatie acid, which was employed for the same purpose as the caustic potasti and carbonate of soda in the patents of Messrs, O. Jones & Berger. The samples exhibited by Messrs, Colman are excellent, and the Jury consequently awarded to them a Prize Medal,

Some very good specimens of starch and starch gum are exhibited by R. G. Treagan, of Leuton, near Notting-ham (Class III., 121, p. 207). The former in the state in which it is used by the Nottingham lace-dressers; the latter, as it is obtained by the action of a carefully-graduated temperature in starch; fit for the use of dvers, who use it to give body and thickness to the colours which they employ in dyeing cotton, woollen cloths, and silk, they emptoy in dyening cottons, wootien citotis, and silk. It is also used by paper-stainers, or printers; and as a elecap but strong grun in the manufacture of adhesive labels. The specimens shown by Mr. Tacker are ex-tent, and the Jury awarded to bim a Prize Medal. In the proceeding cases, account bas licen taken not

merely of the superior excellence of the samples of starch, but at the same time the Jury have also takes into consideration the novelty or ingeauity of the process, and other circumstances which appeared to them to demand once virconstances which appeared to them to demand peculiar notice. The specimens shown by Messrs. Baows & Potsox, of Paisley (Class III., 123, p. 208), con-sisting of several varieties of starch and dextrine from wheat, potato, and sugo, are good, and deserve Honourable Meution. The preparation of starch from sago, or rather the purification of sago meal, which consists chiefly of starch, in now carried on to a very considerable extent. Messrs, Brown & Polson appear to have been the first to employ ehemical means in bleaching or improving the colour of sago-meal, and by the introduction of certain improvements in this process they succeeded in rendering the hleuched starch more perfectly soluble in water than it is in its ordinary state. The samples exhibited by it is in its ordinary state. The samples exhibited by Mesers. Recurr & Son, of Hull (Class III., 125, p. 208) of the same substances, are also deserving uf Honourable Mention. The other samples of starch shown in the English Department are all good; and several of them. indeed, judged merely for quality alone, are excellent. indeed, judged merely for quality alone, are excellent, Some very beautiful starch, prepared from sago, is shown by R. WOTHERSTOON, of Glenfield, near Plaisley (Class 111, 124, p. 208). The Jury deem these, and likewise the samples of potato-starch shown by E. Tecker, of leelfant (Class 111, 122, pp. 207, 208), each deserving of Honourable Mention.

The Jury also deem worthy of Henourable Mention the specimens of starch shown by Messrs. Shand and Muckarr, of Montrose (Class III., 126, p. 208); and that of A. Stickhouse, of Perth (Class III., 154, p. 193*).

As excellent series of specimens of starch from various sources is exhibited by Messrs. D. and W. Millen, of Musselburgh, near Edinburgh (Class III., 127, p. 193*). The Jury considered these, as well as the specimens of starch and dextrine shown by C. Cooney, of Dublin (Class II., 70, p. 200%), and those of H. C. Jennikou, of London (Class II., 99, p. 197), severally deserving of Honourable Mention

In the collections of the Honourable East India Con-PANY (pp. 874, 875), there are several samples of storch for manufacturing purposes; and there is little doubt that they might be prepared in any quantity, and sent over at a low price, as the Rainh of Vizianagram states that any quantity of excellent arrowroot may be had in the northern Circurs for about 4s. (d. per cwt. The specimen of Marana starch, or arrowroot, of Messrs. Cocknuss, of Moorshedalud (pp. 874, 875), is particularly fine, and the Jury accordingly awarded to it

a Prize Medal. The Cassava starch, or fecula of the Jatropha, hibited by Messrs. SPEEDE, of Culcutta (pp. 874, 875),

was also found to be remarkably good, and the Jury accordingly awarded to it a Prize Medal. specimens of sago, and sago-meal or flour (pp. 874, 875), obtained from the sago-palm, Arerga succharifera (Suguerus Rumphii), are contributed from Sumatra, Singapore, and Cuttack,

Besides these, good examples of similar kinds of starch are exhibited by T. Oxtav, of Siegapore (sp. 84, 878), from various parts of the Indian Archipelage, Bornes, Moluccas, Java, Singapore, &c., and by other individuals from Caleutta, from Assam, from Cuttack, Vizagapatam, Tenasserim provinces, Bhattaghlerry, &c.

Some good specimens of starches are also shown in the Ceylon Department (p. 937), especially arrowroot,

and the fecule of the Jatropha; repeated and the fecule of the Jatropha; From Western Africa, a fair sample of arrowroot, together with the plant from which it is obtained, is shown by Warwick Weston (1, p. 952).

In the Canadian Collection, J. PRENDERGAST (125,

In the Canadian Collection, J. PARNDERGAST (123), p. 966) exhibits two specimens of starch, apparently irepared from wheat, one being white, and the obsecoloured blue, for domestic use. These are both very good, and the Jury deemed them worthy of Honourable Mection.

A specimen of starch from potatoes is also shown by BRUNDER & SHIPTON, of St. Hilaire (128, p. 966). This also was deemed worthy of Hononrable Mention.

In the excellent collection of raw produce from British Guitans, sent over by the Breat A materixers at ASS (Science, 1987), there are visual as a first Bedalice p. 17), there are visual as a first Bedalice p. 17), there are visual as a first Bedalice p. 17), there are visual as a first Bedalice p. 17), there are visual as a first Bedalice p. 17), the product these are, starch from the bitter essaws, and arrowners, propared by H. T. Gasartar, of Henrichten places are produced by the production of the production of price places in the production of the production the sweet ensures, plastatian and heek yam, from the cautern coast of Demention of the production of the prod

Very fine samples of arrow root and other starches are shown in the collection of Trinidad raw produce, transmitted by the Guerreno, Lord Hansus. The sampless of coastra or Jatropha starch, arrowroot, and Telman claims or Jatropha starch, arrowroot, and Telman claims of the same starch, are considered specially to deserve Honourable Mention. It is stated that the cultivation of the casawa from which this starch is obtained is found to be every profitable, the vield

being from one to two tons per aere.

Two good specimens of arrowroot from Bermuda are shuwo: the Jury deemed that of — Grav (1, p. 971) worthy of Honourable Mention.

worthy of Honournile Mention.
Some fine arrowrost from Norfolk Island is exhibited
by Sir W. T. DENISON (25, p. 993), and a very good
sample of starch, apparently from wheat, is shown by
W. Mirasay, of Hobert Town (18, p. 993). The Jury
dermad both of these steecimens worthy of Honourable

The Dawego Stanch Factors, of New York (104, p. 1440), shows some samples of starch manufactured from maize or Iudian corn, of superior quality, for which the Jury awarded a Prize Medal.

Some very fine samples of pearl starch are also shown by W. COLEGATE & Co., of New York (301, p. 1453): to these, likewise, the Jury awarded a Prize Medal for excellence.

Au interesting series of flour and starch prepared from maize is contributed by B. B. Kietlann, of Greenhush, New York (84, p. 1438). Among these samples of the various products obtained from maize are specimens of oil.

Good specimens of dextrine or starch-gum are shown by 8. ENGLIMANN, of Karslinenthal, near Progne (Austria 22, p. 1008). The Jury awarded a Prize Medal for these preparations.

Several samples of starch are shown in the Belgian collection. Especially deserving of notice is the starch prepared from maize by C. Van Gestrauten, of Stamme (East Flunders 489, p. 1166). The Jury awarded to this a Prize Medial.

Very good potato starch, prepared from diseased potatoes, is shown by Docquin & Panrs, of St. Josse-ten-Noode, near Brussels (68, p. 1153). This was deemed deserving of Honourable Mention.

The samples of white and blue starch manufactured by H. BOCKEN & Co. (73, p. 1153); the potato-starch of C. VAN BUNNEN, of Bruges (74, p. 1153); and the potato-

starch of G. Beyckarnts,* of Tirlemont (78, p. 1153), were also good, and the Jury deemed them severally deserving of Honourable Mentium.

In the Freach Department there are several exhibitors of starch and starch-gum, derived from different sources. Anongst the specimens most deserving attention is the

starch shown by L. Riuz, of Cambrai (363, p. 1194): to this the Jury awarded a Prize Medal.

An excellent series of starches and dextrines, manu-

An executive series of wareness and dextrines, in manifectured for the use of calico-printers, in shown by J. J. STEINBACH, of Rouen (382, p. 1195): the Jury considered these of superior quality, and accordingly awarded to them a Prize Medal.

these of superior quality, and accordingly awarded to them a Prize Medal.

A very superior sample of starch is likewise exhibited by Belleville Baothems, of Nancy (1078, p. 1229); for this also the Jury awarded a Prize Medal.

for this also the Jury awarded a Prize Medal.
Good samples of well-prepared potato starch are shown
by H. LEBLASE, of Pont l'Abbé, Finistère (570, p. 1205),
and by L. LE PAISANT, also of Pont l'Abbé (590, p. 1206).

and by L. Le Passaw, also of Pont Pable (39), p. 1208), A good specimen of wheat switch is exhibited by Vazow A good specimen of wheat switch is exhibited by Vazow well-manufactured starches from wheat and pointoes are shown by H. Haszer, of Paris (109), p. 1238), and some excellent destrine by M. Accoxa, also of Paris (12), p. 1170). The Jary deemed these five severally worthy of Hommaalle Muttion.

Starch obtained from a species of Canaa (C. discolor) is shown by M. Chapta, of Kunba in Algeria (16, p. 1200). This, though exhibited really as an article of food, the Jury deemed worthy of Hunourable Mention in coanexion with the other forms of starch suitable for

manufacturing purposes.

A considerable number of specimens of starch, &c., are shown in the collection of the Zollverein States, and several of them are of excellent quality. In particular, the wheat starch manufactured by J. C. Haller, of Illale (509, p. 1088), is deserving of special commendation, and

the Jary accordingly awarded to it a Prize Medal.

The "improved" potato starch manufactured by A. C.
WELCKER, Of Wallersheim, near Coblesta (331, p. 1069), and said to be exteasively used for stiffening inuslin, is:
likewise highly deserving of praise, and the Jury, then

fore, awarded a Prize Medal to it.

The Jury also award a Prize Medal to A. Wentz and Co., of Bonn (333, p. 1070), for their superior potato starch.

Samples of wheat starch, manufactured by A. T. Krusz, of Straisund (19, p. 1949), C. G. Kranstra and Soxs (128, p. 1955), and by Beast and Körtra, of Libseck (827, p. 1995), were severally deemed worthy of Honuurable Mention.

ands atention.

Marches prepared from potatoes by L. von Uzeltattz, of Midhiradilitz, in Silevia (21, p. 1692), by L. Elepsential, of Newwice (200, p. 1692); and the sage and central, of Newwice (200, p. 1692); and the sage and vere also decende, each of them, deserting Hamouroble Mention. Some good samples of potatos starch, and starch guin, are also shown by the Louiso Factors at Magdeburg (594, p. 1688).

In the collection from the Netherlands, three exhibitors of starch appear especially deserving of notice. The samples of starch manufactured by C. C. Patss, of Wormerveer (12, p. 1143), are excellent, and the Jary accordingly awarded to them a Prize Medal.

The specimens of potato starch, and dextrine prepared from it, exhibited by SCHÖNNYELD and WESTERBAAN, or Gouda (13, p. 1143), were also judged superior, and a Prise Medal was accordingly awarded for them.

A capital sample of potatu starch is likewise shown by Vissua, Noler, and Co., of Scheidam (15, p. 1143). This the Jury deemed worthy of Hunourable Meution.

Amongst the small series of the natural productions of the natural production of the natura

^{*} Awarded also by Jury of Class III,

of Honourable Mention.

Some good samples of starch are shown by D. G. MIRAT, of Salamanen (128, p. 1337).

Two specimens of starch in the Portuguese Department are found to merit notice, namely, the starch from Estrenusdura, exhibited by MM. Holdeche (454, p. 1313), and the starch from Alemtejo, Evora (453, p. 1313); the Jury deemed both these deserving of Houourable Mention. In the Russian collections, there is a good sample of potnto starch exhibited by Yunghesson, of Marieno, in the government and district of Navgorod (72, p. 1368); the government and district of Navignion - 2-2, to many, ulso a specimen of destrine prepared from potato starch, in the district of Shazk, government of Tamboff, exhibited by the Prince V. Volkonsky (70, p. 1363); some samples of starch and dextrine, manufactured by Verman and Co., of Moscow (30, p. 1367); and some excellent

wheat starch exhibited by C. ROTERNAN, of Reval (71, p. 1368). The Jury deemed these, severally, deserving SECTION 2 .- OIL SERIES.

Notwithstanding the great importance of oil, and the number of purposes to which it is applied in the arts and manufactures, comparatively few English exhibitors have contributed specimens, independent of those sent in illustration of the manufacture of caudles, all of which, as already stated, have been referred to Class XXIX. This is certainly remarkable, when we remember the large quantities of oil annually imported, and the extensive use of it in the arts of enadle and soap making, for hurning in lamps, for diminishing friction in machinery of all kinds, - and especially for locomotives ;-in wool dressing, in the manufacture of paints and variables, as an article of food, for medical purposes, &c. Oils are generally divided into the fat or fixed oils, and the essential or volutile oils; the former class being again subdivided, into fixed greasy oils and drying oils; and, lastly, the fixed greasy oils are separated into those which are usually fluid at all ordinary temperatures, and those which are generally solid, the latter being called tallows, butters, or solid vils. The quality of any oil depends, in part, an the nature and goodness of the seed or unit from which it is expressed; but it is influenced far more by the process employed in its extraction; the value of the oil for many purposes depending on its purity, or the consequently being greatly affected by the conditions under which it is expressed, the mode in which the seed is crushed, the kind of press employed, and, above all, the temperature at which it is pressed.

Among the oils (of which there is a very great number), there are several which are admirably suited for various purposes, but which, nevertheless, on account of their price, depending, generally, on local circumstances, such as cost of freight, &c., are very little or not at all used by our manufacturers. The knowledge, however, that such oils may, at any time, be procured in large quantities, is of great practical value; because, not only is it possible that, by the introduction of improved machinery, or by increased facilities of conveyance, their price may be reduced; but the very existence of such substances tends to equalize the market value of those oils now generally employed-and should, at any time, accidental eiremistances cause the price of the latter to advance, these substances would then be most advantageously introduced. and would probably, ere long, altogether superseds the oils in the place of which they had been originally im-ported. Thus the price of tallow is, to some extent, regulated and kept in elseck by that of palm and coccuant oil; and should the value of the latter nils at any time rise, there are a number of other solid vegetable oils. equally good for all practical purposes, which with a very little trouble might be had in almost any quantity. There are, however, some special purposes in which oils are used, for which it would not be so easy to had good substitutes; such, for example, as the lubrication of fine machinery, and the operations of the wool-spinner. It is probable that, among the numerous little-known oils of tropical countries, there may be many as well smited for both of these purposes as those now generally employed;

siderable practical interest. Whilst, on the one hand, it is desirable to draw the attention of manufacturers and consumers to the numerous foreign and colonial oils not at present imported into this country,-it is at the same time also useful to point out how greatly the value of such oils depends on the care bestowed on their preparation, especially as regards cleanliness of the seed, and the exclusion of impurity of all sorts in the process of extracting the oil.

Of the six principal vegetable oils, namely, palm, eccoanut, easter, clive, linseed, and rape, the first four are imported in the state of oil, only; the two last chiefly as seed: the proportion in which they were imported in year 1850, is shown in the following Table; and if to these quantities are added about a million and a half ewts, of tallow, and about 20,000 tons of whale oil and spermaceti, they will nearly represent the total quantity of oil imported into Great Britain.

An interesting and valuable series of specimens of cotton seed, and of the oil and cake obtained from it after the expression of the oil, is shown by R. Bunn, of Edinburgh (Class III., 68, p. 204). The oil of cotton seed has been made in small quantities for a considerable number of years. In 1785, the Society for the Euconragement of Arts and Commerce offered a prize for its good specimens of new oils are, therefore, always of con- manufacture on a large scale; but it does not seem to have been then taken up extensively, probably in congenerate of the distally of participing. In I has, howexpected of the distally of participing. In I has, however, and the properties of the properties of the conlocation of the participation of the properties of the annual ratios. Of that years this oil has attracted a good and a rate of the properties of the properties of the proticed of the properties of the properties of the proticed of the properties of the properties of the proticed on many; it is only a lower for a reknowted an annuary; it has it have been a properties of the construction of the properties of the properties of the day of the properties of the properties of the proticed of the properties of the properties of the proticed of the properties of the properties of the proticed of the properties of the protensive of the properties of the properties of the protensive of the properties of the properties of the properties of the protensive of the properties of the properties of the properties of the protensive of the properties of the properties of the properties of the protensive of the properties of the prope

Specimens of purified oil, employed for Inbricating machinery, and in perfomery, are shown by F. Hillana (28, p. 197*). The oils are remarkably well purified, nearly colouries, and apparently devoid of all impurity; the Jury, therefore, us articled a Prize Medal.

Specimens of essential oils, including sweet oil of turpentine, me exhibited by Ilharun and Co. (62, p. 199*). Refused oil, prepared for the use of watch and clock taskers; and suitable for Inhricating delicate machinery, is shown by W. A. Haraure, (Class II., 80, p. 196). Good samples of linseed and rape oils are contributed by Md1:newnd Sone (Class III. 179). and

by M'GARAY und Sons (Class III., 132, p. 208).
Fine specimens of various volatile cisk, especially the oil of einnamon leaf, are included in the collection of the LONDOV DEAT TRAIN (CLASS II., 117); and a good sample of English attar of roses is exhibited by J. Ball (Class II., 116, p. 199).

Specimens of clarified oil for machinery, and for hurning in lamps, are contributed by W. A. Rose (Class IV., 27, p. 197*).

Samples of vegetable oils are shown by T. Peterson (Class III., 65, p. 204). A good specimen of blenched linseed oil, for the mannfacture of varnish, is exhibited by H. Penney (Class IV.,

64, p. 199*). In the collection of Excutsun's Patent Camphine Conpaxy (Class IV., 61, p. 199*), sheady alluded to, there is a number of samples of new and refused oils: these are valuable because they are accompanied by samples of the seeds from which they are extracted. The Jury deemed these specimens worthy of Honourable Mention.

seeds from which they are extracted. The Jury deemed these specimens worthy of Honourable Mention.

In the extensive collection of Lavergool Informs, there is a valuable series of oils, including among the valuable

1. Aniseed.	7, Citronella.	13, Nutmegs,

The collection of oils exhibited by the HONOTRAILE EAST INIAL COMPANY is very extensive, and contains a large number of highly interesting specimens; it continues, in fact, one of the most important divisions of the very valuable series of Indian raw produce which they exhibit.

Anamong the volatile oils must be particularly specified the attar of roses contributed by H. H. the Razar or Jerroars, H. H. the Razar or Korran, and H. B. the Razar or Kurstscents in the lippotoans autes; for these the Jury severally awarded Prize Medial. Very apperior attar error of the contributed by appropriate that of the contributed by the Jury awarded a Prize Medial. The property of the Contributed by the Jury awarded a Prize Medial. Besides these species of oftar, or oil of roses, a number

Besates these species of attar, or oil or roses, a numer of other volatile oils are exhibited, many of which are very good; and also a series of artificial attars, or mixtures in various highly-scented volatile oils, with fixed oils, obtained in the manuer sometimes adopted in pre-

paring spurious attar of roses. Oil of aloes wood is contributed from Nepal, Rajpootana, and Ghazeepore; and oil of saffrom by H. H. the Razan or Korati (p. 878), from the Rajpootana states. Several good specimeos of the attar of keora, the

Severa good specificos of the state of a scora, increase pica, or Pondersa educationis, are contributed by II. II. the RAJAN or Korax and others (p. 87%). Some accellent attans prepared from various flowers are also sent by a native perfumer at Benares; the samples of Jannine attas, function groundlymen and J. another; the analysis of the state of the st

able Mention.

Grass-seed oil, obtained from the Andropoyou schurnanthus (or Culomus aromaticus), accompanied by a portion of the seed, and some of the drivel plant itself, are earl tributed from Malwa by R. N. HANLITON, resident at Indore (p. 878): these were deemed worthy of Honourable

Specimens of Sirri, or lemon-grass oil, Andropogon schoosathand are likewise furwarded from Sumatra. The fragrant volatile oil obtained from various species of andropogou is now extensively imported into England for the use of perfumers; it is brought from Travancer under the name of oil of geranium.

A series of attars from different plants is sent from

A series of attars from different plants is sent from Moluccas; but unaccompanied by any information: they are labelled:—

1. Kodjamas. 4. Pulasare. 7. Tjindor. 2. Ananas. 5. Goelang. 8. Abler. 3. Yailang. 6. Tjoelang. 9. Rampsiog. A good sample of oil of cloves is exhibited by T. Key

A good sample of oil of cloves is exhinited by 1. Agr of bladras (p. 678); some excellent oils of kayn-patch, or cajeputi, and miscassar, from the Celches, are shown by STED DAMI (p. 878); and a fine sample of sandalwood oil, obtained from Santalass allows, is contributed from Cauran.

Good specimens of sandal-wood oil are also contributed from Mangalore and from Coorg.

In connection with the volatile sile, an interesting speimen of the Barra (Bornes) campber may be mentioned. General three the supply of the property of the control three three three three three three three three the price of common, campbor. It is asid that the Chines the price of common, campbor. It is asid that the Chines the price of common campbor. It is asid that the Chines ordinary campbor of commerce with, however, is highly improbable; it is most likely valued for its supposed Situations (Constituting Line) and were deemed worthy

of Honourable Mention.

From the latter place there is sample of the oil obtained from another variety of Gazardia, the Values many, or Giordeo Asposition, which is ramied, or valuation seeds, yield about 34 per cent. of oil, in Visinangarum the oil is used exclusively for branching; its value there is stated to be about 164 gallon, other in the control of the contr

 Ground-nut nil, obtained from the seed of the Bhoe moong (Moong phullee), or Arachis hypogra, a plant proty extensively entireted in various parts of India, the seeke contain hout 4 per rent of a clear pole-yclico oil, which is largely used as food, and for lamps. Sumples of this oil are set from Hombuy by T. Ker, Yrom Maley, and from Malecea. Two varieties of the ground-sut, or Kanjing tunah, are cultivated in Malecea, the white seed, and the lower seed; specimens of these, as well as of the are cultivated in Malecea, the white seed are are exhibited. This plant is made cultivated in Jays, in the vicinity of sugar plantations, and the oil-cake is used as montre.

4. Oil of Kossumba, or Kosm-oil, a pale hrownish-yellow oil, obtained from the seeds of Carthumus tincturius, which coutain about 28 per cent. A good sample of this oil, as well as of the carthamus seeds, is sent from Bombuv.

Sommer, or oil of mustard. Excellent oil is expressed to various parts of India from the seeds of different parts of the parts of India from the seeds of different couled black mustard, &c. Specimens of mustard oil from Sinspir toria, from Mecrut; from black mustard, from Tanjore; from Sinspir solutor, from the Choix Napore division; and mastard seed from Ghazcepore, and various localities, are shown.

6. Castor oil, obtained from the seeds of Ricinus commais. Good specimens of this are exhibited from Tanjore, contributed by Mr. Bissior, from Beerbboom, Bellary, Madum, Tinnevelly, and Java (p. 879). The common jougle lamp oil, of which a sample is also shown from Tanjore by T. Bissiur, is a variety of castor oil.

Taijore by T. Bismur, is a variety or canor on.

7. Poppy oil, obtained from the seeds of Fapazer nonniferum. Good specimens are sent from Tanjore, by Mr.
Bisnor, from Calcutta, and from Boarbay (p. 679). Toe
sample from Taijore is alknost coloniess, and deserves
sample from Taijore is alknost coloniess, and deserves

special commendation.

8. Croton oil. Expressed from the seeds of the Narpaula, or Croton sp. nearly allied to C. Liglions; samples of this are shown from Vizinasgram and Gaiping, a very good specimen is exhibited by J. KEY (p. 879).

9. Poon-seed oil. Horeda, cooder, or Plonacottay oil. The seeds of the Poonay tree, the Calophyllon insphyllons or Alexandrian bawel, contain a large quantity of oil,

y. Promiseed cit. Horonas, concley, or Pforascettay, cit. 10 or Alexandras and Saray Contains a large quantity of oil, which constitutes nearly of per cent. of their weight. As commonly perpared, it has a dark greenish colour, derived many common temperatures; but begins to getating their common temperatures; but begins to getating when cooked below 70. Specimens of this oil are exhibited from Palasacettah, from Homolay, from Maiara, and by T. Bienero, from Tanglore (p. 879).

 Limbolee oil, obtained from the seeds of Bergera konsigii; it is of n rich-yellow colour, perfectly clear and transparent; from Bombay.

11. Napala oil, procured from the seeds of the Castimunda, Bhoge cheriola, or Jaterylov ervers; the angularleaved physic unt. A beautiful pole-yellow oil, used by the natives in medicina, and as a hump-oil. Good spenimens are centribated by the COMMISSANT-GENERAL OR MARINES; from Vidinagerian oil Ganjana; an inferior MARINES; from Vidinagerian oil Ganjana; an inferior 12. Lioseed oil—time oil. 24. Shammanatic oil; contributed by W. B. Horser, from Palameottah (pp. 879, 880). 25. Hingun of Hingota.—Bulanites Egyptiaca, from Bombay.

26. Dessy akhroot, obtained from Alearites triloba, the country walnut, from Bombay. 27. Saul tree seed oil. - Shoreu robusta.

28. Chendoorookoo oil, from Madura and Tinnevelly 29. Coorookoo oil, contributed by the Commissions-GENERAL OF MADRAS, from Madura and Tinnevelly, (pp. 879, 880). 30 Koodree oil

31. The collection of oils also includes some ver interesting vegetable hutters and tallows, some of which are almost entirely unknown in Europe. The samples of cocon-nut oil from Messrs. Satsvire (p. 880), of Cossipore, have been already alluded to; besides these, very good samples are contributed by the COMMISSARY-GENERAL OF MADRAS, T. BISHOP (p. 850), from Tanjore; and by other exhibitors from Malabar, Maduru, GENERAL OF Tiunevelly, and Sarawak in Borneo,

Three species of Bassia, indigenous to India, yield solid oils; and are remarkable for the fact, that they supply at the same time, saccharine matter, spirit, and oil, fit for both food and hurning in lamps.

32. Ilpa oil, Eloopei unnay, expressed from the seed of the illupee tree, or Bassia longifolia, a tree abundant in the Madras Presidency, and the southern parts of Hin-dostan generally. The oil is white and solid at common temperatures, fusing at from 70° to 80°. It may be ad-vantageously employed in the manufacture of both

vantageously employed in the manufacture of both candles and sopp. Specimens of this oil are contributed by the Comminant-General of Madhama, (p. 880), and J, Ker (p. 880), and from Madura and Timere-Valiya-(79), and J comminant of the property of the special con-form this seeds of the mal-lower, or Basia latifolia, which is common in most parts of the Bengal Presidency. The oil a good deal resembles than of the Hipphe tree, and may be used for similar purposes. It is solid at common temperatures, and begins to melt at about 70° The specimens of this oil shows by T. Coptestone (p. 880), from Mangalore, were deemed worthy of Honourable

Mention; it is also sent from Canara. 34. Phoolwa, or vegetable butter, expressed from the seed of the eboorie, or Hassia butyraces, a tree, which though far less generally abundant than the B. losgifolia and B. latifolia, is common in certain of the hill districts, especially in the castern parts of Kemaon: in the of Dotee, it is so ahundant, that the oil is

cheaper than ghee, or hutter, and is used to adulterate it; enemper usan give, or muter, and is used to adulterate it; it is likewise commonly hurst in lamps, for which purpose it is preferred to econ-mut oil. It is a white solid fat, fasible at about 190°, and exhibits very little tendency to become rancid when kept. Specimens of this oil, as prepared for food, are shown from Kennann.

35. Miniak Tenkawnng, a solid oil of a pale-greenish colour, a good deal resembling the oils of the Bassia in character, though rather more hard, and approaching more in properties to myrtle wax. This is probably the produce of the tallow tree of Java, described by Sir S. Raffles under the name of minyak kawon; and hy Crawford, as being very common in the western coun-tries of the Archipelago, where it is called "kawan." Mr. Crawford supposes it to be produced by a species of Bassis. According to Mr. Low, there are several varieties of solid oil commonly used in the islands of the Archi-pelago, and obtained from the seeds of different species of "Dipterocarpus." It is a hard yellowish-green coloured substance, brittle, and fassible at about 35°, and when fused, solidifies at about 86°. Specimens are contributed by the

SINGAPORE LOCAL COMMITTEE. It is very easily bleached: indeed, by mere exposure to air and light, it becomes perfectly white; if not too costly, it promises to be a valuable oil. 36. Piney tallow, obtained from the fruit of the peynic

marum, paeuoe, dammar, or doop tree, Valeria indica, a large and quick-growing tree, ahandant in Malabar and Canara. A white, solid oil, fusible at a temperature of 97°. This oil makes excellent gandles, especially when saponified and distilled in the manner now adopted with palm oil, &c.; it has one great advantage over cores-nut oil, that the candles made of it do not give out any sufficienting acrid vapours when extin-guished, as those made with the latter oil do. Samples are shown by T. Corlessone, from Mangalore (p. 879), and from Malabar and Canara.

and from Malabur and Cunara.

37. Cocum où, or kokum butter, obtained from the seeds of a kind of mangusteen, Garciaio parpuraa, unced in various parts of the peniusual to adulterate ghee or butter, and said to be exported to England for the purpose of mixing with bears' greate in the manufacture of pomatum. It is a white, or pale-greenish manufacture of pomatum. It is a white, or pale-greenish yellow, solid oil, brittle, or rather friable, having a faint, but not unpleasant smell, melting at about 95°, and when cooled after fusion, remaining liquid to 75°. Samples of this oil are contributed from Bombay.

38. Kali ziri, or khatzum obtained from the seed of the cast siragum, or buckchie, Fernonia anthelminica, a plant common in Guzerat and the Concan Ghata; there is, however, some uncertainty as to the plant from which this excellent oil is obtained, the label on one of the specimens describing it as the produce of the Salendora persico. It is a bright green, solid oil, having a consistence intermediate between that of tallow and wax, fusible at about 95°, and easily bleached; it has a peculiar and somewhat aromatic odour. Samples of this oil are sent from Bombay.

39. Neem oil, Vaypum unnny, obtained from the ripe finit of the Nim, Arishto, Vaypum, or Margosa tree, Melia azadirachta; a large and beantiful tree, by no means uncommon. The oil is pale yellow, and is solid at ordinary temperatures. Specimens are contributed at oralinary temperatures. Specimens are contributed by the Consinsant-diskinstant of Mannas (pp. 879, 889); from Bellary; hy T. Bisson (pp. 878, 889), from Tanjore; and hy J. Kav (pp. 879, 889).

40, Gutta podah; from Biliton; a sort of wax, of a bright-green colour, which might probably be advantageously used like the other kinds of vegetable wax, in the contribution of consideration of consideration and the contributions of the contribution of the contributio

in the manufacture of candles, associated with the more easily fusible fatty substances

easily fusible fatty substances. Good specimens of lemon-grass oil from Galle, are shown by G. Winters, (pp. 879, 880); and samples of eninamon and citron oils, and the oil of the Bengal quince, or Ægle marmetos, from Ceylon, are also exhibited; the elimanano oil from Meuers PALLETT, O'HALLOMAN, and Co. (pp. 879, 880), of Colombo, is very good. There are likewise some excellent specimens are years of the contract of the contra of cocon-nut oil, intended to illustrate the process of its manufacture, consisting of the copperab, or dried nut, the expressed oil, and the stearine and claime purified. and obtained separately; for this valuable series a Prize

Medal was awarded. A valuable series of eighteen samples of Ceylon oils in contributed by T. A. Picus (p. 938)—see also East India Collection (pp. 878, 879)—of Kaudy, the names of these are-

The oils, Nos. 5 and 7, are nearly colourless. value of this collection would have been considerably range of this correction would make been accompanied by any practical information. The Jury awarded a Prize Medal for these oils, together with the series of gums and resins shown by the same exhibitor.

Some fine specimens of myrtle or berry wax, from the

Cape of Good Hope, are exhibited by J. LINDENGERO, of Worester district (45, p. 950). This is an excellent material for the mannfacture of candles, when employed in conjunction with other solid fits. The Jury awarded a Prize Medal for these specimens.

From Western Africa an interesting collection of ails and ail seeds in contributed by Warvarx Warrow (I, p. 1952), consisting of Shea butter, or palam butter, otherwise the first of the Miscolesia, or Hassing Parkin, a tree closely resembling the Busin Interfaces, and Parkin, it was to the Miscolesia and Fasting Miscolesia, and Fasting Africa, and the Africa Miscolesia and Sheath and Tallambara, the oil is solid, or a greyths-white colour, and fuses at 57°. Specimens are also shown of Beguies seed and Ground-nut (Arrotate Appropri), and of the oil expressed from them; and like-the Africa Miscolesia and Africa Africa

A specimen of the 8hea butter is also exhibited by Dr. McWillaian, from Eggs, on the river Niger (5a, p. 853, 854), which was deemed worthy of Honourable Mention. A good specimen of myrels or candle berry wax, accompanied by candles made from it in the crude auxention of the speciment of the speciment of the speciment of the beached state, and a dried branch of the plant itself, bearing lawree and fruit from New Branzie's (25, p. 870), or Honourable Mention.

Good samples of cocos-nut oil are contributed by the ROYAL SOCIETY OF NATURAL HISTORY OF THE MACRITUS, (4, p. 970), and by Mr. MELLON, likewise from the Mauritius (6, p. 956).

Specimen of hard oil, from the litter Pomerrom, Benedina of the or cargo all, from the Sacquist hard for the Grangian control of the Cargo and the Cargo and

Another sample of crub or caraya oil is also shown in the collection of Traindad, may produce, exhibited by Lazan Hazans (see p. 71; p. 753), as well as a portion of cocos ann inj. of which a considerable quantity is obtained of cacao batter, obtained from the seeds of the Theoleman canes, a well-known white soil dist, families at about 120°. Some excellent olive oil, the produce of New South Wales, it exhibited by R. Hazarz and Sowa (5, p. 951°). Independent of its interest as coming from a colony, this it was deemed worthy of Hosonrable Mention.

A good amples of dive oil, from Such Australia, is also challed by the Convariance American challed by the Convariance American (see p. 11). They also show some analysis and of the Legischief of the Convariance and the Convariance (see p. 11). They also show some analysis and of the Legistation of the Convariance of the Convarianc A remarkably good sample of oil of peppermint is shown by H. G. and L. B. Horchkiss, of Lyons, New York (156, pp. 1446, 1447); for this the Jury awarded a Prize Media.

An interesting specimen of maize, or Indian corn oil, is contributed by B. B. Kiatland, of Greenbush, New fork (84, p. 1432).

continuous by an An Accelerate reire of samples of Austrian lisreed and lisseed oil in exhibited by A. Szratsnocz, of St. Georgia, near Manthauen (108, p. 1013, consisting of University of St. Georgia, near Manthauen (108, p. 1013, consisting of University of St. Georgia, near Manthauen (108, p. 1013, consisting of St. Georgia, near Manthauen (108, p. 1013, consisting of St. Georgia, near the state of the Austrian of St. Georgia, p. 1014, p

(102, p. t013); this was deemed worthy of Honourable Mention.

The chief oils shown in the Belgian collection are of animal origin, but there are also several good vegetable oils. L. E. Bissel, of Anderlech, over Brussel, 687, p.

animal origin, but there are also accural good vegetable oids. L. E. Busk, of Anderleeb, oer finnesis (18, p. 105), exhibits remarkably fine clear samples of reflical vegetable oil: for these the Jury assured in Prize Media, Good Inseed oil, prepared for the use of gainters, and of Branche (18, p. 1945). L. Cataryo, of Branche (18, p. 1194). L. Cataryo, and Demacro-Brancount, of Courtai (29, p. 114), exhibits some good severally deemed descript of Homostale Mention.

Some vegetable was from China, is contributed by Irza Some vegetable was from China, is contributed by Irza Annual China (China) (Ch

Japan is also shown. Samples of eastor oil, lettuce oil, sufflower oil, turnipseed oil, oil of nielle or nigella, linseed oil, and oil of cotton seed, are sbown in the Egyptian collection; the latter is the most remarkable: the series of Egyptian oils was deemed worthy of Special Mention. Cotton-seed oil in the raw state, and the sams refined

Cotton-seed oil in the raw state, and the sams refined and Blosebed by a patient process, are exhibited by DE Géniny, of Marseilles, where the mannfecture of this oil from Egyptian seed, and its purification, are now carried on to a considerable extent (1613, p. 1284). For this specimen the Jury awarded a Prize Medal. Specimens of various volatile oils are shown by Hegures

janior, or Grasse, Var (881, p. 1222). These cilis are prepared by a direct process of distillation, discovered by the exhibitor about a year since, and by means of which so il is at one obtained in a struct or purity, so that no volution of the contract of the process of the contract of the contract

for tress one.

Specimens of volatile oils prepared for the use of perfumers, are also exhibited by C. D. Méxo, of Grasse, Var (1356, p. 1341). For these likewise the Jnry awarded a Prize Medal.

awarded a Prize Medal.

Samples of very superior hleached oil, for the use of painters and varnish-makers, are contributed by E. P. Hano, of Paris (866, p. 1221). The Jury swarded a Prize Medal for these specimens.

Some very interesting specimens of artificial volatile oils, and perfumed essences, are shown by M. A. C. Collas, of Paris (801, p. 1219). The Jury awarded a Prize Medal for these.

a Prize Medal for these.

Some very good hleached oil, prepared for the use of painters, is shown by Dr. Reotz. of Paris, (1466, p. 1246); this was decused worthy of Honourable Mention.

A very fine cake of purified campbor is exhibited by W. CONRAD, of Paris (1156, p. 1233); this was deemed wortby of Honourable Mention.

Purified oil, prepared for the use of watchmakers, for

diminishing friction in machinery, and for fire-arms, &c., is shown by F. Joller, of Mer, Loire-ct-Cher (276, p. 1192).

Oil for lamps and machinery of various sorts is also exhibited by M. Mozaku (325, p. 1192).

Purified lineed oil, and oil boiled with oxide of lead,

are shown by RENAULT, of Bordeaux.

A number of good samples of oils are shown by various exhibitors, in the very interesting collection of the raw produce of Algeria, contributed by the Minister of War (see p. 69). In particular, the series shown by Coater, junior, of Bab-el-Oned (22, p. 1261), deserves notice; it consists of good specimens of the oils of lineed, sanflower, cameline, sesamum, mardia, easter, olive, colza, mustard, and cotton seed, together with the seeds from which they are expressed. The Jury awarded a Prize Medal for this series.

A good collection of oils is also shown by H. J. MERCURE, of Cheragas (37, p. 1261), including ofive oil of 1850, and a sories of essential uils, for the use of perfumers, namely-

1 11 Petit grain

2. Citrine.	7 Geranium.	12. Neroli.
3. Melarose.	8. Jasmin.	13. Cedrat.
4. Absinthe. 5. Myrthe.	9. Citron. 10. Portugal.	14. Bergamotte.
For this also the	Jury awarded a Pri	ze Medal.
Fine samples o	f olive oil, prepared	in 1850, are likewi

exhibited by J. Bonde, of Philipville, Constantine (9, p. 1259), and E. F. Marrae, of Bougie, Constantine (35, p. 1261); these were each deemed worthy of Honourable Mention.

A series of volatile oils, or essences, are also contributed by P. Simouner (51, p. 1262), consisting of-

1. Sauge. 2. Absinths. 3. Verveins. 4. Citronine.	5. Citron seste. 6. Melarose. 7. Portugal zests.	8. Bigarrarde, 9. Neseri, 10. Neroll,
Pine-peodle oil	a volatile liquid o	btained during the

desiccation of pine leaves, or needles, in preparing a fibrous material for the use of upbolsterers (see p. 82; p. 1054), is exhibited by C. G. Fanian, uf Humboldsaw, near Breslaw (95); this was deemed worthy of Humburable

Purified oil, intended for the use of watehmakers, is runned on meetical for the ase or watermakers, is exhibited by J. L. F. Schaanx, in Desau (806, p. 1094). Fair samples of rape-seed, and rape oil, from Holland, are shown by A. Di. Haax, of Rotterdam (9, p. 1143); these were considered deserving of Hosourable Mention. A large number of exhibitors of olive and other oils is found in the Portuguese collections. Among these may be specified fine samples of olive oil from J. L. DE CA-PRINCES MENEZES (460-1, p. 1313); from ALMEIDA PRARXCA (462-3-4, p. 1313); from De MADDO (465-6, p. 1313); from J. LARCHES (467-8, p. 1313); from the COUNT IN FARRODO (469-70, p. 1313); from J. B. PINTO (471-2, p. 1313); from Almenta Silva, and Co. (473-4-5-6-7, and 480, p. (313); from J. D'ALBEQUESQUE MELLO (478-9, p. 1313); from the Masquis DE Fixalbo (481-2, p. 1313); and from the COUNT DE LINHARDS (483-4, p. 1313); each of these was decided worthy of Honourable Meution.

Excellent specimens of several volatile oils, including those of lavender, juniper, rosemary, and lemon, are sent by F. M. C. Lean. (497-500, p. 1313); for these the Jury awarded a Prize Medal.

Very good samples of palm and ground-nut (arachis) oils, from Angola, are exhibited by F. R. HATALMA; (495A, p. 1313); these were deemed deserving of Hosourable Mention. Fair samples also of castor, linsced, and almond oils are likewise shown by V. Bunnay (493, n. 1313), from Estremadura.

From the Linsinsk Forest Institute, in the government of St. Petersburg, district of Czarskoe Sielo (83, p. 1369), are samples of the empyreumatic volatile oil, obtained by the destructive distillation of birch bark; this substance is employed in the preparation of Russia leather, and gives it that peculiar and agreeable odour, which helps

to preserve it from the attacks of insects. This oil has a dark-brown or almost black colour, is somewhat thick, and has a specific gravity of 0'939. Its odour is strong, disagreeable, and empyrenmatie; when poured upon paper, it farms a brown greasy stain, which, hawever, soon dres, and after a short time, when the empyreumatic odour is dissipated, there remains only the peculiar and agreeable scent which belongs to Russia leather. The Jury The Jury

secut which occurs to husain reather. The Jury awarded n Prize Medal for these specimens. Fine samples of walnut, linseed, colesced, and castor of the samples of walnut, linseed, colesced, and castor of, p. 1302). Good olive oil is also shown by the Cris-VALUE MANCU SIMONE, of Sussari (15, p. 1303); and by S. MESINA, of Nuoro (31, p. 1303); and some good linseed oil is contributed by J. Canvt, of Genoa (22, p. These were severally decided deserving of Honourable Mention.

In the Spanish collections, an excellent sample of the essential oil of lemons is shown by J. Canales, of Malaga, (242a, p. 1344). For this the Jury awarded a Prize Medal. The manufacture of olive oil in Soain has undergone very considerable improvement during the last few years; in particular, the process for expressing the oil has been rendered more rapid and effectual by the introduction of the bydraulic press, and thus the injurious consequences which resulted from the partial fermentation of the fruit are avoided.

Fire samples are contributed by the Province of Almeria (164, p. 1339); from Alburquerque, by C. S. Montestinos, of Badajoz (167, p. 1339); from Alma-dovar del Rio, by the Province of Cordova (165, p. 1339). dovar del Rio, by the Province of Cordova (165, p. 1339), being the produce of the wild olive; from the village of Nightlea, by J. Zavas, of Grausda (168, p. 1339); from Santa Fé, by A. Dizz DE RIDERA, of Granda (172, p. 1339); by M. FERNANDEZ, of Malaga (169, p. 1339); and by the Province of Seville (171, p. 1339). These were severally deemed worthy of Honourable Mention

Samples of olive oil are likewise exhibited by the AGRICELTURAL BOARD OF VALENCIA, from D. V. TORTOSA, and D. J. CARASCOSA (173, p. 1339): by the AGRICELTURAL BOARD OF COMINOVA; and by the COEVEY OF SORMANIES OF SATISONS (174, p. 1359). A specimen of linseed oil, from Lorea, is contributed by D. —, of Murrin (170, p. 1359); and nut oil from Ovledo, by D. S. ALVAREZ CALEJAA (166, p. 1359). ALLEJA (166, p. 1339).

A cake of hard vegetable wax, obtained from n plant

indigenous to the northern parts of St. Domingo, is conreibated by Sir R, SCHOMBURGK amongst the other raw produce of that island. It is not saited for the manu-facture of candles alone, but, like the herry wax of the Cape of Good Hope, serves very well to mix with other

fatty substances (see p. 83; p. 1429).

A few samples of oils are contributed from Tunis, including, besides some of the common fixed oils, samples of several of the volatile oils used in perfumery, specially the oil or attar of roses, and of jasmine, together with a few mixed essences, such as those of quinee, grange,

benzoin, alocs, &c. Some good specimens of linseed oil, and of rape oil, both refined and unrefined, are shown by Joseph Owen, of Copenhagen (44, p. 1359); these were deemed worthy of Honourable Mention.

The Turkish collection of raw produce includes a nu-merous and interesting series of oils, both fixed and volatile, from various localities, the former include the following (see p. 69):-1. Almond 2. Castor -- Damascus.

	Laure		-	-	-	Diendgiya.

Good samples of olive oil are exhibited in the Tuscan door samples of one of are called to be belley districts near that place (31, p. 1293); by Rusch llaothers, from Calici, near Pisa (32, p. 1293); by D. PACINI, from Buti, near Pisa (33, p. 1294); and by the Chevalier C. A. Saracini, of Seemin, from Castel-move, Berardenga, near Sienna (34, p. 1294). These, al severally deemed worthy of Honourable Mention, These, also, were

SECTION III .- DYES AND COLOURS.

The arts of dyeing and printing in colours have undergone very considerable modifications during the last balfgone very considerable modifications during the last balter than the control of the priority of the proportion in which some of the priority dynamics. Dyring is purely a chemista. Dyring is purely a chemical operation; and the following table, which represents the imports for consequently it has improved in exact proportion to the following table, which represents the imports for consequently it has improved in exact proportion to the following table, which represents the imports for consequently it has improved in exact proportion to the following table, which represents the imports for consequently in the imports for consequently in the imports for consequently in the importance of the priority of the importance of the priority of the proportion in which some of the priority dynamics of the priority of the proportion in which some of the priority of the proportion in which some of the priority of the proportion in which some of the priority of the proportion in which some of the priority of the proportion in the proporti

which regulate the formation of colour, and the union of colouring matter with the various vegetable and animal substances which come under the operation of the dyer, A vast number of new colouring materials have been discovered or made available, and improved modes have bosn devised of economically applying those already in use: so that the dyer of the present time employs many substances of the very existence of which his practical predecessors were wholly ignorant. From the increased use of many of the vegetable colours, and from the imuse of many of the vegetante consults, and from the im-proved modes of applying the colouring matters, a demand has maturally sprung up for various dye-stoffs; and at the present time, many of the dyeing materials of distant countries are beginning to exerte the attention of practical me; for though they have long been acquainted with

many of these substances, it is only recently that the even practicable. even practicance.

At the present time, by far the greater number of the vegetable dye-stuffs used in Great Britain are derived from foreign countries. The following Table shows the quantity of some of the chief of those substances imported io the years 1848, 1849, and 1850; but it must be remarked, that it includes the quantities imported for re-exportation, as well as those retained for home consumption by our manufacturers:-

matter that becomes fixed only on those parts on which the mordant has been printed, and after this the mucilago is readily washed away.

But allowed, the operations of design and pointing are

Is resultly "Water-on segmentations of dyving and printing are than, to some extent, different, yet the dysestaffs or colouring matters used are entirely the same, and are applied to produce the same results; so that, in fact, the art of coton-printing, setting apart pattern designing, may be regarded as a neuer modification of the art of the processes of fixing cotonring matters, it is found that there are many substances capable of affording very

beautiful, useful, and lasting colours, which have not, of themselves alone, a sufficient affinity for the fibre; but which, nevertheless, may be easily combined with it through the agency of certain other substances not in themselves colouring matters, but having an affinity both for the substance of the fabric and also for the colouring matters, hy which means the colouring matters are effectually united with the fibre. These substances (for the most part metallic solutions), are termed "mordania," and besides their peculiar action in changing the hues of the colouring matters are the means by which some of the most lasting, and therefore most useful, dyes are attained. The bases of the mordants chiefly used are the oxides of iron, tin, copper, and alumina, in combination with sulphuric, muriatic, nitric, acetic, and other acids. From the great diversity of substances used in the art of dyeing, including metals and metallic compounds, woods, flowers, roots, barks, leaves, fruits, insects, &c., all of which respectively require essentially different treatment, there is necessarily considerable variety in the methods and processes employed; and this variety is still further increased by the different nature of the substances dyed such as wool, silk, leather, cotton, flax, and wood.

In the substances of the greatest importance—wool

In the substances of the greatest importance—wool, sitk, and cotton—experience shows that the colouring matter which suits the nature of one does not, necessarily, suit that of another; and indeed, for the most part, the process of dyeing those three substances is so distinct as to have caused the dyera to be generally divided into woollen, silk, and cotton dyers. It is found that, as regards the use of the strong mineral acids, which are employed both to brighten, and-assisted by beat-to fix some colouring matters, an important difference exists between wool, or silk, and cotton. Animal substances between wool, of sits, and cotton. Animus successors will bear, uninjured, a much greater proportion of scid, and of the two, wool being the coarser fibre, is less easily injured than sits; but both will bear, with advantage, a proportion of scid which would corrode and destroy the fibre of cotton. It is necessary, therefore, to be very cantious in the use of acids on cotton goods; and the dyeing of a mixed fabric constitutes one of the nicest parts of the art, where a mixture of animal and vegetable fibres has to be printed with perhaps six or eight brilliant colours at the same time.

In illustration of these processes, Mr. Burch shows a In Hustration of these processes, orr. Justin accomplete collection, w supra, of the various chemical agents employed by the dyer, including acids, alkaline, and alkaline salts; metallic salts, used both as mordants and in the formation of metallic colours, and a very namerous series of vegetable and animal dye-staffs. The mode of block-printing, and the manner in which several colours are successfully applied, are also well illustrated. The more important of these substances may be briefly

19

serated as follows :- Sulphuric acid, or oil of vitriol.
 Muriatic or hydrochloric acid.
 Nitrie acid, or aquafortis.
 Nitro-muriatic acid. Actio or pyroligneous acid.
 Ctrio acid.
 Tartarie acid. 8. Oxalic acid. 9. Iron sulphate, or green vitriol, ,, acetate, or iron liquor. ,, nitrate chloride, or murlate. 12 Tin chloride, or muriate. Alumina. 16. Alum. Alumina, acetate. Copper sulphate, or blue vitriol. 18.

nitrate Lead, nitrate. Zine sulphate, or sugar of lead. 25.

Potassa carbonate, or pearlash.
,, bltartrate, or cream of tartar.
Potash binozalate, or salt of sorrel. 96 ferroprussiate. chromate. **

biehromate. Soda, carbonate. Ammonia muriate, or sal ammoniac. 33. Lime, quick.

,, chloride, or bleaching powder. All these substances are used by the dyer, either in preparing the fibre to receive colouring matter, or as mordanta to enable it to combine with the colour, in the direct formation of coloured compounds; to heighten animal or vegetable colours; or as "resists," or "dis-charges," either serving to prevent certain parts of the fabric, to which they have been applied, from receiving any colour in the vat, or to discharge or remove it in

sees when the whole has been dyed one uniform colour. For this important series a Prize Medal was awarded. The dye-stuffs exhibited are as follows:-

COLOURING MATTERS OR DYE-STUFFS. Logwood: — obtained from Campeachy in Sonth America, the wood of the Hamatorylon compechicaum: it is enhibited, 1st, in the block; 2nd, in the chips as cut . rog root — entired tree tampesty in South quantity of tunine. It is subblished as gathered. After the subblished as in the shelike, the is the block paid, the theips as cert in the subblished, the is the block paid. The temperature of the temperature of the temperature of the subblished as a square activate of the benefit in the draw paid, the coloring matter per-benefit is the street paid to the paid of the paid to the paid of the paid to the

brown. Specimens are shown of these various colours dyed on cotton, silk, and wool.

2. Peachwood, or Nicaragua wood:—from Lima, South

2. Peacewood, or Nicaragua wood:—Iron Linas, contin America; the wood of a Casalpinia, eshibited in the block, chips, aqueous extract, and the colouring matter precipitated black with iron, red with tin, red with alum, and brown with copper. Specimens of dyeing on silk,

wool, and cotton. 3. Sappanwood, from Siam ;-the wood of the Casal-

o. ceppanwood, from stam;—the wood of the Casal-pinia appan, exhibited in the block, cbips, squeous ex-ract, and precipitated dark brown with iron, red with tin and with alum, brown with copper; with dyed samples. 4. Fastic, from Cuba :- the wood of the Rhus cotinus enhibited in the block, chips, aqueous entruct, and the colouring matter precipitated olive-brown with iron. yellow with tin, and yellow with alum; with dved

samples. Ebony, the wood of the Diospyros ebenum;—exhibited in the block, chips, aqueous extract, and the colouring matter precipitated—olive-brown with iron, yellow with tin and with alum ;- with dyed samples

6. Harwood, from the west coast of Africa:-the wood of the Baphia sitida (1); exhibited in the block, chins. aqueous extract, and the colouring matter precipitated, dark brown with iron, red with zinc; red with alam;

brown with copper; - with dyed samples.

7. Camwood, from Sierra Leone; -- the wood of the Baphia nitida, shown in the block, chips, squeous ex-tract, and the colouring matter precipitated, - black with iron, red with tin, red with alum; - with dyed

8. Indigo, from the East Indies ;- a well-known blue colonring matter obtained from the leaves of the Indigofera tisctoria. The process of dyeing with indigo consists in deoxidizing it, or depriving it of a portion of its oxygen, when it assumes a green hne, becomes soluble in water, and then readily enters the peres of the cloth immersed in the indigo vat. When the cloth is properly saturated, it is exposed to the action of the air, and the indigo speedily reabsorbs on year, and again assumes its original colour and its stability; or, if united with a yellow colouring matter, the result is—a green. It is exhibited in the lump, in powder, in its green deoxidized state dissolved in water; and also in a state of pulp, or minute subdivision, effected by treating it with strong sulphuric acid. In the last case it is not a "fast" dye, but by the

first mode of treatment, it is one of the most permanent colours. Samples of indigo dyes are shown.

9. Wond;—from France and the north of Europe, a colonring matter analogous to indigo, but of a daller hae, obtained from the leaves of the Initis tisctoria; it is now but little used. Exhibited in the lump.

10, Quereitron Bark, from South America;-the bark of the Oserous tinctoria; it is exhibited in the crusted or ground state, in the aqueous extract, and the colouring matter precipitated—olive-brown with iron, and yellow with clum :- dved samples are shown.

11. Alder bark ;- the bark of the common alder of Great Britain. Aloss gletisose, shown as chips, as aqueous extract, and the colouring matter precipitated,—grey with iron, and pale amber with alum.

12. Catechu, from the East Indies; -- an extract of the ood of the Acacia cateche, containing much tannin; it is shown in Immp, and its colouring or tannin matter precipitated,—black with iron, brown with copper. 13. Valonia, from Turkey and Asia Minor; - the cap

13. Valonia, from Turkey and Axia Minor;—the cap or shell of the acorn of the Quercus argileps; It is ex-bibited as gathered. Also the aqueous extract and the colouring matter as precipitated,—black with iron, 14. Nut-galla, from Turkey;—an eacrescence growing on the Quercus injectoria, which contains a very large quantity of tunnin. It is exhibited as gathered. Also

obtained with alum. Madder is the colouring matter used in the Turkey red dye, so celebrated for brilliancy

and permanency 16. Sumach, from Sicily ;- is a small plant, the Rhos coriaria. The sumsch is exhibited as ground for the dyer's use; also its black precipitate with iron,-vellow

with tin, - yellow with alum.

17. Weld; - grown in Great Britain and the north of Europe: is a small plant, the Resolu Intesia, a specimen of which is exhibited. It is used as a yellow dye, or as n component of green. Its aqueous extract and yellow

precipitate with nlum are shown. Persian berries, from the Levant;-the berries of the Rhamas infectories, which afford a yellow dye. They

are exhibited as gathered. Also the squeous extract and the colouring matter precipitated, - yellow with alum and with tip. 19. Turmerie, from the East Indies; -- the root of the

Corcount longs. It is exhibited as a root, and in the ground state as used by dyers. It affords of itself, without a mordant, a vellow dye, which is brilliant, but unfortunately not very permanent, samples of which are 21. Orchil: - (Roccella tinctorio), from the Canary

21. Orenit - (necessary transferred) from the first seasons in the rocks by the sea-shore. The plant is of a pule-stone colour, but yields a magnificent purple matter, which fixes in wool and silk without a mordant. It is reddeced by scids, and rendered blue by alkalies, thus affording a great variety of tints. Its aqueous purple solution is shown, with samples of dye on silks and wool.

22. Annatto, from Sonth America ;- an orange coling matter obtained from the seed of the Bira orelians, The colouring matter is brought to this country in maenveloped in rushes. It is soluble in alkalies, by which means it is fixed in the cloth. The annatto is exhibited The annatto is exhibited

as a mass, with samples of its dyes.

23. Safflower; — from Egypt, the Levant, Southern Asia, &c...; the dried petals of the Corthonous tinctorio, from which is obtained a very beautiful colouring matter, that attaches itself without a mordant, and is extensively used in silk and cottoo for a variety of shades of pink, rose, crimson, scarlet, &c., but which, unfortunately, does not possess the power of resisting the action of soap. The safflower as imported is exhibited; also the alkaline extract precipitated a fine rose-tolour by an acid, with dyed samples on cotton and silk. This colouring matter is not suitable for wool.

24. Cochineal, from Mexico; is a small insect, a variety of Coccas, which lives upon different species of the Cactus opuntia or nopal. It affords a fine red colouring matter, which is extensively used on silk and wool, par-ticularly the latter, the whole range of the best red dyes on wool being due to the colonring matter of this insect. The two varieties exhibited are known in commerce as the "black grain" and "silver grain;" terms which the "black grain" and "silver grain;" terms which arose from the fact that, when first imported, this insect was considered to be a seed or grain, and its dyes were spoken of as "grain" colours. The aqueous and amnoniacal extracts of the colouring matter are shown, also the colouring matter precipitated with tin and with alum. It forms very fine and permanent dyes in reds, crimsoos scarlets, &c., samples of which are shown on wool and silk. It is not applicable as a dye for cotton.

25. Lac-dye, from India;—the colouring matter of

a substance formed on the hranches of various trees by the puncture of a small insect, similar to cochineal, the Corus lacer. The resinous matter, being separated, forms the "sheline" of commerce, and the colouring matter, the lac dye, is thus obtained. It is used as a red dye on wool, but its colour is inferior to that from chineal. The dye is exhibited, with dyed samples. Having thus briefly conmerated the substances exhibited, it may be observed that the dye samples show merely those colours which result, entirely and directly, from the substances in connexion with which they are from the substances in connection with which they are placed; and do not, in fact, truly represent the art of dyeing, which frequestly depends on a nice mixing of tints, and is affected by the combination of several,—

artistic excellence. But in combination with these dyzing materials, and illustrating the subject as a whule exhibited samples of skein-dyeing by three London dyers -by Mr. CRABOT on wool, by Mr. REYNOLDS on silk, and Mr. Buscu nn cottoo: these may be taken as a fair sample of the uses to which the dvers of London put the variety of drugs and substances we have enumerated. In dycing the skein previously to the threads being woven, Mr. Itureh, who shows all his productions in this com-hination, exhibits also a series of dyes in "fast colours" on Lisle thread, which are used for the cotton glove mannfacture, in which the ordinary dyes are sadi fugitive; also a series of dyed lace cotton, dressed by a peculiar process to resemble the hard-thrown marabout silk, which is extensively used in the manufacture of velvet, gauze ribbons, and other fabrics in which a firmpess of texture is desirable.

Some excellent illustrations of the native vegetable dyes of Scotland are shown in Messrs. Lawson's valuable collection (Class III., 105, p. 206). These are now nearly all superseded by cheaper and more brilliant dyes of tropical conotries.

A very good series of samples of superior orchil, cud-bear, and other preparations of liehens, is exhibited by Messrs. Sattu & Son (69, p. 200*), accompanied by specimens showing the colours dved with them. The Jury deemed these dyes of superior excellence, and accordingly awarded a Prize Medal for them,

A highly-complete and instructive series of lichen pre-parations is exhibited by Woop & Exprond (Class II. 47, p. 192), including the chief varieties of lichens known merce, the colouring matters prepared from them, the different peculiar colouring and other principles con-tained in them, or obtained from them by chemical procoses, and illustrations of the practical uses of lichen dyes to silk, feathers, wool, teather, marble, wood, &c. The chief lichens employed in the manufacture of orchit and cudbear are the following: -

Commercial Name.		Plant.	Whence Imported,		
LVC		Ramalina furfirmosa - Rocella fuciformis {	Angola. Mauritius and Madagascar. Lima. Valparaiso. Cape de Verda Jelands. Canary Islands, Sweden,		

Of these nine lichens, the first grows as a parasite apon trees; all the remainder upon rocks: the first is the richest in colouring matter. The samples of cudbear and orehii shown are numerous, and well illustrate the gradual development of the colour: the whole collection is highly creditable, and the Jury, therefore, awarded a Prize Medal for it.

Specimens of sufflower, and good illustrations of its use in dyeing silk, are shown by Loxo & REVNOLDS (75, p. 205*): these were deemed deserving of Honourable

Ventior Good specimens of several dye-stuffs are exhibited by J. MARSHALL, of Leeds (Class II., 68, pp. 194, 195), including cudbear and orchil, tarmeric, and an interesting series of lac-dyc: these also were deemed worthy of

Honourable Mention. A sample of chicory woad is exhibited by SAUNDERS and GATCHELL, of Dublin (71, p. 200*). It is stated that this substance, which can be used as a blue dye in the place of real woad, muy be profitably grown and sold at about 8l. per ton, the price of real word varying from 201. to 301. per ton.

A large and highly-valuable collection of dye-stuffs is ployed by the natives io different parts of the East Iodies p. 880). This important series forms part of the collection of raw produce for which the Jury recommended the award of a Council Medal. In addition, they awarded a Prize Medal to their Highnesses the RAJANS of KOTAN and of Curcu (p. 880), for the various specimens of dyestuffs which they have contributed to the East Indian

1. Amongst the more important of the well-known Indian dyes, one of the principal is, of course, indigo, and of this a number of excellent specimens are contributed. The best are those shown by Mosses. MACNAIR, of Babookally, Messra Arrumon, of Cuddapah, and of Babookany, Medern, Arburtinkor, of Cucaspan, sinc the proprietors of the Johnsan Facron (p. 889); for each of these the Jury awarded a Prize Medal. Very good samples of indigo are also contributed by the Razans of Koyan and Cercu, from Kotah and Brooch; and also from Sindh and Madrae (p. 889). A complete and highly-interesting model of an indigo factory, showing all the different processes through which the dye passes in the process of manufacture, is likewise ex-

2. Specimens of the Pala or Palar indigo, prepared in some parts of India from the Wrightia (Arrism) tinctoria. a plant which flourishes io dry and barren lands, are cot tributed by Mr. G. T. Fischer, of Salem (p. 880). It is said that this indigo is occasionally mixed with the ordinary indigo of commerce. The Jury awarded a Prize

Medal for these specimens.

Medal for these specimens.

3. Fair samples of safflower or Kussoumbs, Corthonous fineteria (p. 880), are contributed by the Rajani of Kotani, from Kotahi by W. S. HUDSON, from Assam; from Dacca; from Bohilkund; from the Celebes; and from the neighbourhood of Calentia. There is probably no dye more easily injured by careless collection than safflower: the great superiority of the Chinese over the ordinary East Indian safflower is chiefly due to the greater care with which the Chinese collect it

Circumn longs (p. 880), is sent from 4. Tormeric, Nepal by his Highoess the MAHARAJAH; from Asse from the Raipootana states; from Rehilkund; from Caleutta; from Beerhhoom; from Cuddapah; from Bombay; from Madras; and from Java.

 Sappan-wood, Casalpinia sappan (p. 880), contri-buted from Bengal; from the Tenasserim provinces; and by Tax Kin Seng from Siam, and from the Philippine

. Municet, Munjuth, or Indiao madder, Rubia munjistha (p. 880). This is a valuable dye-stuff, and hitherto not so well appreciated as it deserves, for some of the colours dyed with it are quite as permanent as those dyed with madder, and even more brilliant; its use is, however, gradually increasing, and it is unquestionably well worthy the attention of dyers. Good samples are exhibited by Captain Survit, from Assam (p. 880). For these the Jury awarded a Prize Medal. Specimens of Muniest are also contributed from Nepal

hy his Highuess the Mananasan; from Aden; and from

Chay-root, Oldenhadia umbellata, a red dye similar 7. Chay-rook. Chrominatin inthoritata, a red aye similar to Munject, and used to a great extent in the southern parts of Hindostan by the native dyers. This dye is not held in very good estimation to Europe: it seems, however, to deserve a better reputation than it at present possesses. Attention to this dye-stuff was drawn in 179e by a special minute of the Board of Trade, recommending its importation; but Dr. Bancroft, who made some experiments with a sample of damaged chay-root, considered it inferior to madder, and hence discouraged its further importation. Specimens are contributed by Captaio OGILVEE, from Masulipatam and from Palamcottah (p. 880). Samples of the Bulu or Mangkudn wood, and root, much used throughout the Indiao Archipelago, are shown from Malacca, Java, and the Celebes.

8. Annotto. The seeds of the Bira orellana, from which this colouring matter is prepared, are contributed

from Assam, and from the vicinity of Calentia.

9. Morinda bark. The bark and root of various species of Morinda are used in different parts of the East Indies, and are equipped as a very valuable red dve. Specimens

of the Muddi or Al, Morioda citrifolm, are exhibited by the Rajah of Kotan from the Rajpootana states; and Ach, or Morinda tinctoria, are contributed from Patna. The colours dyed with the Morinda are, for the most part, oot hrilliant; but the colouring matter is far more permanent than many other red colours are, and with improved management would probably rival that of madder; it would, therefore, perhaps, be a useful dye-stuff; it appears well worthy the attention of dyers.

10. Liehens. A considerable number of different liehens are shown from various localities; some of these contain a good deal of colouring matter, and might, therefore, be advantageously employed in the manufacture of orchil, cudbear, and other preparations used by dyers. Among the specimens exhibited may be mentioned those from Robilkund; from Moorsbedabad; from Darjeeling; and other parts of the Himalayas; from the Tenasserim provinces; and from Sindh

11. Mangrove bark. Kahoung, Rhizophera manale:used to dye a chocolate colour, from Arrakan. This was one of the colours introduced by Dr. Bancroft, and for the exclusive use of which he obtained an Act of Parlia-

12. Pulas, Tisso, or Madooga flowers :— Buten frondom, used for dyeing red, from Taooa, from the district of Berrbhoom; from Cuttack; and by Captaio Outlyte from the Nisam's country (p. 881).

13. Hursinghar flowers :— Nyctuathes arbor-tristis, oned

as a yellow dye, from the RAJAH of KOTAH, in the ates of Rajpootana; and from Cuttack (p. 879).

14. Ukulbere or ushurgh;—Datisca connabina, a bark

used for dyeing yellow: it contains a bitter priociple re-sembling that of quassia, from Labore. 15. Marking out; — Somecarpus macardism, from Assam, from Calcutta, and from Robilkund.

16. Capilla Ringhill, Rerso, Patany; -- prepared from the dried fruit of the Rottlera tinctoria, and used by the natives to dye orange: the colouring matter is apparently of a resinous nature, or at least is accompanied by a large quantity of resin; it is a brilliant and tolcrably permanent dye; contributed from Assam and from Cuttack.

17. Gaju gum; - used as a yellow dye, from the 18. Gamboge, (Hebradendron nambonides). Several excellent specimens are contributed from different local excellent specimens are contributed from timerent occur-ties. A good sample from Siam is exhibited by G. G. Nicol; and another is shown by Messrs. Ilamons, in their collection of Archipelago produce (2, p. 998).

Other specimens of gamboge (Garcisin tisctoria) are contributed from the peninsula of India, hy several exhibitors, especially hy Dr. CLEGHORN from the forests of Mysore; for this the Jury awarded a Prize Medal to 19. Myrobolans;-the fruit of various species of Ter-

misalia, containing a considerable quantity of astringent matter, and therefore used io tanoing as well as in dye-ing; from Moorshedabad, Calcutta, Rohilkund, Cuttack, irrapoore, Assam, and the Bajpootana states.

20. Querens infectoria, galls, from Calcotta and Chota Nagpore

21. Abutilos strictum? from Calcutta and from Assam. 22. Myrica sapida, bark, from Rohilkund. 23. Hrightin antidysenterien t from Putna.

24. Harndah berries (Terminalia sp. t), from the hill racts of Orissa Rerro, a purple dye, from Arrakan.
 Thit-nan-weng, a chocolate dye, from Arrakan.

27. Sagah bark, from Singapore. 28 . Ting-ojet, bark and wood, nsed as a dark purple dye, from Arrakan. 29. Thit-tet, wood and bark osed to dye red, from

30. Mooshe, from the Raipootana states, 31. Mucha, from the Rajpootana states

32. Kayee Kndrang, a yellow dye sent by SETD ONAR from Malucca.

The-dan, a red dye, from Arrakan.
 Borul, from the Rajpootana states.

35. Bunchong Balu wood, from the Celebrs. 36. Muchkee, from the Raipootana states.

 Samak bark, from Singapore.
 Lopisip bark, from the Celebes. 39. Benkita-barrung, produces a dark purple dye, from Borneo.

40. Kayu Oobab, a red dye, from Labuan.

41. Kayu Samuck, from Labuan 42. Saracundraputtah (Cassia fistula), from Palam-

cottab 43. Pattangha bark, sent from the Nizam's country by Capt. OGILVIE.

44. Cherenjee bark, from the Nizam's country, seut by Capt. OGILVIE. 45. Avaraputtai (Cassia auriculata), from Palam-

enttal-Of many of these dyes, little or nothing more than the name is known, and the Jury, baving no evidence as to their use, are, therefore, wholly unable to express any opinion as to their probable utility io this country. They consider the series, however, as highly valuable and important. Several of the dve-stuffs are evidently rich in

colour; most of them may be easily had in large quantities, and at comparatively low prices; they are, consequently, well worthy of the attention of practical dvers. Specimens of gamboge, turneric, myrobolans, and a yellow resinous substance resembling gamboge, called

Gajn gum, are contributed from Ceylon. A sample of behen, or orchilla weed, from the Cape of Good Hope, is exhibited by C. WATERMEYER (51, p.

A specimen of cam wood, from the conflue ivers Niger and Tchadda, is shown by Dr. Mc WILLIAM FIVER AUCT and Tenniolis, is shown by Dr. M. WILLIAM, (3.4, pp. 535, 594); and some rends insign from Abbrokuta, is contributed by Dr. BEZELLAY (12, p. 954). In the collection from British Gainans, there is but one dye or coloning material, namely, the "Lana dye," exhibited by H. A. Kow (3.5 n. p. 809). This substance is obtained from the fruit of the Lana tree (*Grajas Janesiusa, Linuxon), a tree very boundant throughout the

colony, particularly on the banks of the river Berbice; the colour dyed with it is a good bloish black. The colours dyed with the fruit of this tree are remarkably permanent, a fact which has very long been known, though bardly any attempt appears to have been made to introduce it to the notice of European dyers. The Jury deemed this specimen worthy of Honourable Mention,

deemed tas specimen worthy or fromourance sciention.

Samples of fastic (Huss cetians): logowood (Heustray-lon compechianson); and turmeric, are included in the
Trinidad collection of raw produce.

A promising specimen of lichen, or orchilla weed from
the Falkland Islands (Roccella factjormis), is exhibited by

G. T. WHITTINGTON (p. 987).

The various dark-coloured resins of Australia have already been alluded to; the colouring matters of the different species of Xauthorhou, though not remarkably brilliant, are well worthy of notice. Very fine specimens of some of these reside are exhibited by the Colonization

Assumance Corronation. (See page 76).
Good samples of the Xanthorbera resins are shown from Flinders' Island, by J. Milligan (81, p. 994).
A remarkable colouring material, called blood juice, the odnee of a Norfolk Island tree, and said to be used for

dyeing calico, and as an indelible marking ink, is con-tributed by Sir W. Denison (290, p. 997). The Jury tributed by Sir W. Dentson (290, p. 997). The Ju deemed this substance worthy of Honourable Mention. Specimens of Hinan (Elascarpus hisaus), a bark used in New Zealand for dysing black (5, p. 1001), are ex-hibited by McVar; these will be again referred to as a tanning material. The flax and other substances shown in illustration of the use of this bark by the natives, in dyeing black, are remarkable for the depth and brilliancy

of the dye. Lichen, or orchilla weed, from New Zealand, is contributed by J. A. SRITH (14, p. 1001): this sample appears to contain a good deal of colouring matter, and was,

therefore, deemed worthy of Honourable Mention.

A very fine sample of Alkanet root (Anches disctoria) is shown in the Austrian collections.

Specimens of Hungwa, or saffron; turmeric; and a red colour from China, are exhibited by HER MAJEST COXEUL at Shanghae (p. 1418); samples of whi-mei, a green dye; and of the fruit of the Gardenia radicans. nsed to dye yellow, are also shown.

In the Egyptian collection are specimens of indigo, saffron, and sunuch.

The specimeos of French madder, though not numerous, are of considerable interest and importance. A small series of samples of madder, and of garmeine, as obtained from madder for the use of the dyer, are exhibited by

the Changes of Connecce at Avignon* (1049, p. 1229). The Jury awarded a Prize Medal for these specimens. A good specimen of garancine is also shown by LAZARE and Lacrotz, of Avignon (905, p. 1223). This affords a and LACROIX, or Avignon (903, p. 1223). This affords a highly-interesting example of the practical application of science to the improvement of a natural product. The exhibitors, finding their madder inferior to that grown in

other localities, were led to institute a chemical examination of the soil; It was found to be deficient ju lime, an element of all these soils in which the best madder is grown; the land was accordingly well mampred with lime, and the result was a marked improvement in the quality of the madder. The Jury awarded a Prize Medal for this specimen. Some excellent samples of orchil are exhibited by C.

MOTTET (932, p. 1224). awarded a Prize Medal. For these, also, the Jury

Madder, of very superior quality, is likewise shown in the Algerian Department of the French collection; in particular, the specimens of G. DE MONTHUNT, of St. Joseph, Oran (38, p. 1201), who also shows a fair sample of saffron, were deemed worthy of commendation, and

or sattron, were deemes worthy or cosminendation, and the Jury accordingly awarded Prize Medal for them. The snaples of medder, exhibited by J. Prolin, of Constantice (43, p. 1261), and of Druzz in S. Y. Marn, of Orbol, Omn (23, p. 1361), were likewise considered very good, and each worthy of Honoarnable Mention. As the specimen of saffron, contributed by Dr. Lurzow (AB, p. 1261), or Born, Constantine, was deemed worthy

of Hononrable Mention.

A good sample of "wond," the blac colouring matt repared from the Isatis tinctoria, and which is probably entical in nature with indigo, is shown by Gressler, of Trichtelborn, near Erfart (Zollv. 4698, p. 1089). was deemed worthy of Honourable Mention.

Madder root, from Athens, is contributed by A. Mal-ANDRINUS (3, p. 1400), and from Eubers, by G. PHILLIPros (4, p. 1401).

The colouring matter of safflower, prepared in a con-centrated form for the use of dyers, is exhibited by C.

JAEGER (Prussis 469, p. 1078).

Extract of madder, said to be prepared by a new and cheap process, is shown by A. Scharkeners, of Neustre-

litz (3, p. 1134) A remarkable vellow resinous substance, somewhat resembling gamboge, and called pipitzahuac, but of which no description is given, is contributed from Mexico.

In the Portuguese collection, several specimens of dyeing materials are shown. The most important are a set of licbens, or orchilla weeds, namely, wood orchilla, from Angola, St. Thomas, and Mazambique; and rock orebilla from Angola, Vinnando Minho, Cape Verde Islands, and from Madeira (505 to 508 n). These were deemed worthy of favourable notice.

Wood orehilla from the Cape rock, and rock orehilla wood ofenital from the Lape roes, and rock orbitals from the Berlingues Islands, of good quality, are shown by F. R. BATALHA (509 and 509A). Some good samples of sumach are exhibited by M. B. FERREIRA, junior (510, p. 1315). These were deemed severally worthy of Honouralké Mention.

Two good samples of Russian modder are shown from the Government of Derment. This important root is already cultivated to a considerable extent in Russia, but not nearly in sufficient quantity to meet the demand; so not nearly in sumcient quantity to meet the demand; so that large quantities are imported from Holland, and elsewhere, every year. The specimens shown, which are of good quality, are exhibited by Krain Racinia Ocil, of Cubi (87, p. 1359), and by Baraiker Abakel. (85, p. 1359). These were each deemed worthy of Ho-nourable Mention.

^{*} Awarded also by Jury of Class Il.

Besides these, the Russian collection includes safflower, from Telaff, in Titlis, exhibited by POPUS KYAYLLOFF (90, p. 1869), affron, from Baki, in Shemakha, exhibited by SERGUS AYVAZOFF (91); yellow berries (Rhamar isjectorius), from Cabi, in Derbent (92); sumuch, from Nookha, in Shemakha (93); and the wood of the Statics coriaria, from the Government of Stavropol.

A considerable number of specimens of dveing materials from Spain are exhibited; the best are, the madder; wond or pastel blue (Isatis tinctoria); sufflower or alazer (Curthamus tisctorius); wild sumach; and weld or "gualda" (Resedu Intesia); shown by the AGRICUL-TURAL BOARD of SARAGOSSA (148, p. 1337-38). For these

TURAL BOARD of SARAGOSSA [148, p. 1337-38]. For these the Jury awarded a Prise Medal. (See page 71). Superior samples of madder are bkewise contributed by the Province of Murcis (86, p. 1334); D. ——, of Valladolid (142, p. 1337), and A. MATISSAN, of Segovia (144, p. 1337). These were severally deemed worthy

of Honourable Mention. Other specimens of madder are shown by the Province

of Cadiz, which exhibits the wild or indigenous madder or Castar, which exhibits the wild or indigenous madder from San Lacar (138, p. 1337), by D. ——, of the Canary Islands (141, p. 139c.), by D. ——, of Hoelva, by D. Marxasar, of Segovin, from Cuellar (140, p. 139c.), by R. SEMOVILLA, of Segovin, from Cuellar (143, p. 139), and by D. ——, of Zamora (91, p. 1334). Extract of madder, for dyers, is also contributed by J. Mascos, of Valladelid (17, p. 1334).

D. — of the Canary Islands (141, p. 1337, by D. (86, p. 16 ferona (179, p. 1333), by D. — of Marcia (86, p. 1337), by J. Martiser, of Seville (145, p. 1334), and by D. — of Zanora (31, p. 1334). Two specimens of saffron are shown; namely, by Dona C. Canasta, of Ciudad Real (138, p. 1337), and by D.

A good sample of Alkanet root (Aschuse tiactoria) is contributed by D. ——, of Murcia (86, p. 1334), and

a fair sample of sumach, from Torrelobaton, is shown by D. _____, of Valladolid (146, 1337). Three specimens of dye-woods are shown in the collection of Caba woods, exhibited by the BOTARIC SOCIETY

In the collection from Tunis are shown three sa of indigo; one of saffron; dried pomegranates, said to be used for dyeing yellow; and a specimen of a dye-stuff

named Gämr A very valuable and numerous series of dye-stuffs is exhibited in the Turkish collection, including some of those well known in commerce, and also a few new ones. Samples are shown of-

Besides these, a considerable number of samples of ills, valonia, sumach, and other similar substances, used both in dyeing, and also in tanning, are exhibited. (See page 93.) The substance called Tabach, from Konish, spears to be the dried petals of a flower; it is a rich violet colour, and merits forther examination. Sirpik is said to be used in dyeing yellow.

A good series of samples of madder, both in the form of root, and also reduced to a powder, for the use of dyers, is exhibited by the TECHNOLOGICAL INSTITUTE of Tuscasy (47, p. 1294), and forms part of the collection for which the Jury awarded them a Prize Medal, (See page 71.)

SECTION IV .- TANNING MATERIALS.

Notwithstanding the number of different substances which have from time to time been introduced for the use of tanners, it is, nevertheless, pretty generally ac knowledged that there is nothing superior, or even equal to, good oak bark, and that all attempts to hurry the proeess beyond a certain point by the use of concentrated solutions of tan, &c., are for the most part failures, as solutions of tan, &c., are for the most part failures, as the manufacture of good leather, to a great extent, de-pends on the process being conducted in a slow and gra-dusl, but--at the same tune--thorough and complete manner. Oak bark is, however, by no means the only astringent bark well astited to the use of the tanner, and in various parts of the world other similar substances are used with very great success. All these tanning materials, though they may not be considered, by the English tanner, as equal to the best oak bark, are nevertheless of value to him; they may be employed in conjunction with onk bark, or even as a substitute in times of scarcity, or when the price of bark is high: in fact, the very existcuce of such substances tends to keep down and equalise the price of bark, and prevent it from undergoing those great fluctuations in value which would necessarily occur were it the only tanning material available to our manufacture

The quantity of the chief tunning materials imported in 1849, and the countries from which they were obtained, is shown in the following table:---

Specimens of oak bark, gambier, myrobolans, samach, and valonia are included in the collection of HULL Inroars; the yearly importation of these substances into the port of Hull is about 2,500 tons. A fine sample of pure Palermo aumach is exhibited by

J. KITCHIN (126A, p. 205*), as ground for the use of tanners and dvers Besides the tanning materials already imported, a con-

siderable number of new or little known astringent sub-stances are shown in the East Indian collection, some of which appear well to merit the attention of practical men. Amongst those exhibited are the following:-1. Terra japonica, kut or cutch, and catecha, the wellknown extracts of the Acacia catecha, and certain allied plants, from Rutnagherry, Calicot, Moorsbedahad, Patna,

panns, from nathagnerry, cancor, moorsuddingd, Patna, Calentta, Rohilkand, &c. Gambier, the extract of the Nauclea gambir, from Singapore.

2. Acacia or Babool bark, the bark of Acacia arabica,

and A. cuteche, &c., from Madras, Scinde, Shahjehanpore, Robitkond, and Assam 3. Mangrove bark, the bark of the Rhizopora Mangle, from Arracan, Malabar, and Singapore

4. Turwar or cassis bark; Avaraputtai, Tangada jigota (Cassia auriculata), from Vizagapatam; and Sara-condraputtai, Cuasia fistula, from Madura and Tinnevelly 5. Saul-tree bark, Sherea robusta, from the Saul

forests 6. Pomegranate rind, Punica granatum; Darunka

pucke, Dadima jegota, from Kemaon and Vizagapatam; Dalumka kbola, from the vicinity of Calentta. 7. Jumoon bark, Engenia jombolana, from Cuttack, and the Chota Nagpore division.

Samak bark, from Singapore.
 Peal bark, from Cuttack.

10. Dhak gond, pulas, of butea kino, the red astringent exudation of the Butea frondess, from Rajpootana, Cut-tack, Vizagapatam, and Meerut. 11. Vangay or gum kino, Pterocarpus dalbergoides, from Malabar.

12. Kino, or astringent extract of the Buchawanis latifolia (?, from the district of Chota Nagpore, 13. Majoophul, or gall nuts, Fiens infectoria, &c., from

Chota Nagpore and Robilkund divisions 14. Sumrut ool Usc, or tamarisk gall, Tamerix indica,

14. Someti on Use, or management of from Bombay and Lahore,
15. Divi divi, Casalphina coriaria, recently introduced from South America, contributed by Dr. Falconer, from

the Botanical Garden at Calcutta. 16. Teree, Casalpinia sp., contributed by A. Sconce, from Chittagong. 17. Myrobolans, the dried fruit of various species of

Terminalia, extensively used both in dyeing and for tunning; Terminalia belevice, Baheera bhura (or hurrah), from Mirzapore, Robitkuod, and Calcutta; Terseisalia chebula, from Robitkund and Patna. Terminalia citrian, from Patna, Moorshedabad, Cuttack, and contributed also from Assam by Captain SMITH (p. 881). Terminalia elata, (?) Marada, from Mirzapore. Terminalia angusti-

folia, humtokee, from Calcutta 18. Emblic myrobolans, aomla berries, Phyllasthus emblica, from Rajpootana. 19. Mochrus, Bombax molabaricum and B. heptaphyl-

lum, from Meeru 20. Gaub, the fruit of Diospyros glutinosa, from Cal-

From the Cape of Good Hope M. THALWITZER scode samples of taoning bark (3 and 27, p. 949, 950), apparently the bark of a Minoso. Deserving of Honomrable Mention. Some good samples of hemlock bark, illustrating its use as a tanning material, are exhibited by J. ALLON, of Montreal (100, p. 195). These the Jury deemed inte-resting, and deserving of Honourable Mention.

Specimens of the bank of the hog-plum tree, Spendian which is commonly used in British Gniona for tanning, are shown by T. B. Duogin (36, p. 980). A sample of Courida bark, Actorsoia aitida, a tree very common on the castern coast of Demerara, likewise used in tanning, is exhibited by D. SHIER (58, p. 980).

Mimosa bark, bark of the black wattle tree, Acario mollivina, and mimosa extract, the inspissated decoction of the bark, are contributed by T. Button, of Launceston (22, 23, p. 993). These also were decaded worthy of Honourable Mention. A specimen of the same bark is likewise exhibited by - REES (314, p. 998), as prepared for the use of tauners, by chopping into small fragments. Kino from the blue-gum, Escalyptus globulus, the stringy bark, and other Escalypti indigenous to Australia, are contributed by J. Milligan and H. Hull (288, p. 997), and by the Colonization Assurance Conforation.

Several good specimens of New Zealand maning barks are exhibited by J. M.Vav (5, p. 1001). They are ac-companied by hides tunned with the different barks, which are labelled Towai, Tanekuha, and Hinau, the latter being also used in dyeing black. The Jury considered these samples as deserving Honourable Mention. Samples of New Zealand tanning barks are also shown

by Tao Nul, a New Zealand Chief (Gillman, 44, p. 198*). ny 140 AU, a New Zealand Uniet (1-imm), 44, p. 1987). Some good specimens of oak bark from Bruges are exhibited by Sraumar and Bary of that eity 197, p. 154). These the Jury deemed worthy of Honourable Mention. Specimens of oak bark, in the state used by tanners, are shown by the Boans of Austicutivate of the Grando

DUCKY of HESSE DARMSTADT (13, p. 1126, 1127) Good samples of Portuguese sumach are exhibited by MANOEL BAPTISTA MONTEIRO, from Beira-guarda, Algaroc, &c. (510, 511, 512, 513, p. 1313). Bark or rind of the wild pomerranate. Punica crana-

ten, and of the wood and leaves of the samach tree, are contributed from the Government of Shemarha, districts of Shoosha and Mookha, in the Russian empire (88 and 93, p. 1369).

In the collection of raw produce exhibited by the AGRICULTURAL BOARD of SARAGOSSA (148, pp. 1337, 1338) AGRICULTURAL DOUBLE OF COMMENTS A good sample of su-is a good specimen of wild sumset; a good sample of su-seet is likewise contributed from Torrelolaton, by

D of Valladolid (146, p. 1337). Specimens of tanning materials are exhibited by Eu-HAGE ALY ELMAJBOOK, in the collection from (137, p. 1416). able Meution. These were deemed worthy of Honour-

Excellent samples of several important tunning mate-rials (p. 1386), well known in commerce, are shown in the Turkish collection; these include-1. Oak galls - - - Kutava.

SECTION V .- FIBROUS SUBSTANCES.

the whole series of raw produce, including as it does the nists admitting the existence of a large number of dismaterials for several of our most important manufactures tinet species of the genus Gossypium, whilst others con-

-cotton, flax, hemp, and the numerous vegetable fibres employed in conjunction with, or as substitutes for, those employed in conjunction with or an authority in substances. For convenience of arrangement, the subject is divided in the following pages into three distinct heads: the first, including the different varieties of cotton; the second, flax and hemp; and the third, consist-ing of the various other vegetable fibres.

The total quantity of cotton, at present annually imported into Great Britain is very nearly 800,000,000 pounds; the proportion in which it is imported from different countries is shown in the following Table, which represents the imports of 1849:-

Per cent	Dist.

A very useful collection of cottons of different countries, arranged so as to show the peculiarities of each fibre, is shown by Dr. Royle (107, p. 203*). An extensive series of the cottons imported into Liverpool is likewise exhibited in the LIVERPOOL collection of imports (pp. 811, 812); these are accompanied by memoranda of the selling prices of each variety in the Liverpool market in October 1850, which, though very useful and instructive, it must be remembered do not express the true overage value of the different cottons at all times, but merely their price at that particular period. It is evident that accidental circumstances may, at any time, cause a rise or depression in value of a particular cotton, as well as give rise to fluctuations in the price of cotton generally.

A good deal of uncertainty appears to prevail respect-ing the botanical distinctions to be noted between the This division is, perhaps, one of the most important of various cotton plants of different countries; some botasider them as chiefly varieties of a much smaller number of separate species. According to Dr. Royle, who has most recently investigated the subject, the different variees of cotton may be classed under four distinct species of Gosspium, in the following manner:-

 Gossuprism indicum or herbaceum; the cotton plant of India, China, Arahia, Persia, Asia Minor, and some parts of Africa. 2. Gossypium arboreum; a true cotton, indigenous to

India

3. Gossypium barbadense; the Mexican or West Indian sotton, of which the Sea Island, New Orleans, and Upland Georgian cottons are varieties. It was long since introduced into the Island of Bourbon, and thence into India; hence it acquired the name of Bonrhon cotton. Gossypium peruvianum, or acuminatum; which yields the Pernambneo, Peruvian, Maranham, and Brazilian cotton, especially distinguished by its black seeds, which

adhere firmly together: this variety, also, has long since been introduced into India.

The important discovery, by MERCER, of the influence of caustic alkali in modifying the fibre of cotton, has been already alloded to. He has shown that, by steeping cotton in a cold solution of caustic soda, the fibre loses its flattened ribbon-like form, and assumes a more or less cylindrical shape. This change gives rise to three re-markable effects: the fibre becomes smaller, it gains in strength, and at the same time it acquires an increased affinity for colouring matter. After a minute and careful examination of these effects, the Jury, being convinced of the high practical value of the process, determined to recommend the award of the Council Medal to Mr. Мкиски (38, pp. 555, 556, see p. 69).

The collection of raw cotton exhibited by the Hon. EAST INDIA COMPANY (pp. 882, 883), is, as might be ex-pected, large and highly interesting. It consists of a series of samples of the indigenous cottons of various parts of the Indian empire, and samples of the cottons raised in the various Government experimental farms during the last thirty years, illustrating the effects produced, and the improvements effected, by the numerons attempts which have been made during that period to improve the cotton cultivation of India.

In considering the native cultivation of cotton in Iodia, it must be remembered that, besides the exports to Enrope, very large quantities have every year been mised for home consumption by the native manufacturers, and for exportation to other castern countries,—especially China;—the latter alone having, till within the last few years, generally exceeded the entire annual quantity ex-ported to Europe. Thus, during the ten years preceding 1833 the quantity of raw cotton exported from India to England was about 250,000,000 of pounds; whilst in the same period the quantity exported from Iudia to China, &c., was about 540,000,000 pounds. On comparing together the average total quantity of cotton imported into Great Britain in the years 1830, 1840, and 1850, from the United States and from India, it will be found that whilst the former, during those three periods, has in-creased in about the ratio of 500,000 bales, 950,000 bales, and 1,200,000 bales, the latter has increased in the ratio of 67,000 hales, 163,000 bajes, and 300,000 bajes : showing, therefore, that, large as the annual increased importation of American cotton into England has been, the increased consumption of East Indian cotton has, in proportion, augmented even more rapidly.

The chief varieties of native India cotton, named ac cording to the districts where they are produced, are

1. Surst.	7. Berar.	13 Ladom.
2. Broach.	8 Coimbatore	14. Agra.
3. Dharwar.	9. Compta.	15. Guserat.
4. Tinoevally.	Io. Nagpore.	16. Cutch.
5. Cuddapah.	11. Belgaum.	17. Copean.
6. Nellore.	12. Dacos.	18. Saugur.
Of all these cotton	s it may be genera	lly observed, th

though in some cases the fibre is beautifully fine, it is invariably short, generally badly cleaned, and too often injored, hy careless collection, bad packing, and faulty inland transit. It must be borne in mind, that these

short staple cottons of India cannot be compared with the long staple cottons of the New World; they are, in fact, quite different fibres—they must be treated in a different manner, and their uses are perfectly dissimilar. The question of how far long staple cottons can be ad-In equestion of now far long staple cottons can be ad-awatageously cultivated in India is perfectly distinct from that of improving the production of short staple varieties. The real practical question to be considered is, not whe-ther the East Indian cottons can be made to compete with the long staple American cotton, but whether, hy care and attention, by judicious cultivation,-improved me chanical contrivances, -and the application of skill and perseverance, it may not be possible so to improve the common East Indian cotton as to give to it those characters and properties which will render it of more value to the manufacturer, by enabling him to use it even more largely, and with greater profit, than he is able to do at

On examining the samples of the native indigenous cottons of India, the chief causes of their inferiority are No care or skill in the cultivation, of course, will render the fibre of short staple cotton like that of the long staple variety; but, in many cases, the fault is not the shortness of the fibre, it is, that the cotton has been ruined after it has grown and ripened: either by bad management the staple is broken, or, by exposure to the weather, and by the addition of dirt and impurity of all sorts, its value is most materially diminished. difficulty rests not so much with the cotton as with the cultivator, and with the middleman : the indolent habits, and the dislike of the former to trouble of any sort, stand more in the way of improvement than anything else; whilst the want of proper encouragement to the native to persevere, and, in some cases, the opposition of the Brahmin, combine to prevent any real progress. In those cases where care and attention have been paid, the native cottons sent over are excellent; and there is no doubt that their value will slowly and steadily increase in the English market, if the cotton be sent to market

clean, and in the state in which it is gathered From the samples of experimental cotton, illustrative of the various uttemnts which have been made to intro-

duce the cultivation of American cottons into India, it is obvious that though the introduction of Sea Island-and the other long staple American-cottons may, for the most part, be said to have failed, yet the cultivation and improvement of the New Orleans cotton in India (which, though not the finest, is certainly the most valuable cotton in the world; have been attended with very consi-derable success. The experimental cottons grown from New Orleans seed at the Government farms, from 1830 down to the present time, prove, most satisfactorily, that any quantity of good, sound, useful cotton may be im-ported from India; and that it only needs time and per-severance to give it a high place in the estimation of our mannfacturers. Among the best specimens may be no-ticed the samples taken from the produce of the Government farms at Coimbatore, imported by the "Beresford and "Colonist," and the samples of Sca Island and New Orleans cotton from the experimental farms in Mysore The specimens of cotton grown under the directions of Dr. Wight (p. 882), who has done so much to improve and extend the cultivation of cotton in Iudia, are so good, that the Jury awarded to him a Prize Medai. The cotton grown at Cuddoor hy F. D. MEPPEN is so remarkable for the goodness of its staple, its cleanness, and the careful manner in which it has been handled, that the

Jury deemed it worthy of Honograble Menting Avery promising sample of cotton, grown from Per-nambuco seed, on Mr. Hextio's estate at Sanwak, in Bornco, in exhibited. The staple is pretty long, though a little conrae and uneven; still, it is very clean, has a good colour, and there is no doubt it would find a ready market at a fair price. The Jury awarded a Prize Medal for this cotton.

Among the good samples of well-cultivated native cottons, those of Mr. G. T. Fischer (p. 882), of Salem, may be mentioned. The Jury deemed these samples worthy of Honograble Mention.

A good sample of Pernambueo cotton is exhibited from

Tenasserim; the staple is fair, but a little unequal: it is

l'ennasermi; the stapte le fair, but a little unequair it is a good, useful cotton, and bas a healthy colour. The cotton from New Orleans seed, cultivated at Be-gauna, is somewhat degenerated; it is, however, very well cleaned, in good condition, and is a good, useful cottom. Some of the samples of American cotton from Dharwar are likewise worthy of commendation. Besides these, other good samples of cotton are contri-

hnted by private individuals; special notice must be taken of the Barmese cotton contributed by Dr. Mosrox, of Moulmein (p. 882); the samples of cutton from Bageen, near the Chumbul River, exhibited by his Highness the Maharajah Jyasee Rao Scindia, of Gwalior (p. 882); the cotton contributed by his Highness the RAJAH of KOTAH, from the Rajpootana States (p. 882); and the cotton from Cnteh, contributed by his Highness the Rao

of Curcu (p. 882).

Mention may here be made of the very beautiful fibre of the "simool," or silk-cotton tree, Bembax heptaphyllast, which, owing to the shortness and want of strength of the fibre, combined with its peculiar elasticity, is incapable of being span like ordinary cotton. It is occasionally, in India, more especially in Assum, spnn into a y loose and large thread, which is then woven into cloth with a warp of some other fibre, and forms a soft, warm, and very light fabric. The silk-cotton, being a very tender fibre, cannot be used with advantage as a stuffing material alone; but it is highly probable that it might be very advantageously used in combination with other substances, not merely for purposes of upholstery, but even in the manufacture of mixed fabrics, and for various other uses in the arts. It was suggested by Dr. Percival, in 1787, and by Beckmann, in 1793, that this fibre might be advantageously employed as a substitute for beavers' fur, in hat-making; and Le Breton states that its importation into some countries was forbidden. for fear that it should be used to adulterate beavers' hair. Practical obstacles were, however, found to interfere with this application, and it appears that they have only re-

Specimens of native, Bourbon, and Sca Island cotton, grown at Batticaloa and Jaffna, in Ceylon, are exhibited. 1448) An interesting series of samples of cotton from Malta are exhibited by G. Puls (p. 944), of Moutebello, including Nankeen cotton, Sen Island cotton, and mastoidon cotton:

the latter is a fine cotton; it has a very fair staple, both strong and silky.

Very promising specimens of cotton from Port Natal are exhibited by T. Bazuzt (30 s, p. 950), and C. Maxuzi, of Cape Town (11, p. 950). In both cases the staple is good, and it is evidently a fine and valuable cotton, but budly handled. To each of these exhibitors the Jury awarded a Prize Medal.

Samples of cotton from the West Coast of Africo are shown by Warwick Weston (1, p. 925). The stuple though short, is fine, and if well handled this would pre-The staple, bably be a useful cotton: it was deemed worthy of Hononrable Meution.

A specimen of wild cotton, collected from the banks of the Niger, is contributed by Capt. H. D. TROTTER (5, p. 953).

Three samples from Barbadoes, exhibited by A. READE (972), consisting of Persian or greenseed, common Demerara, and vine or Pernambneo cotton, are interesting; the latter very superior: they were deemed worthy of Honourable Mention.

A series of excellent cottons is contributed by different exhibitors from British Guiana. Amongst these may be mentioned fine, strong, and good-coloured Sca. Island cotton from Batavia Plantation, on the river Mahaica, Demerara; — D. Blatn (71 & 72, p. 981); for these the Jury awarded a Prize Medal.

Excellent Sea Island and other cotton is also shown Excellent Sea Island and other cotton is also shown by J. F. Bee (74, 76, p. 981) from Woodlands Plantation, on the river Mahaica; the staple strong and very good: for these also Honourable Mention was awarded.

Some very good samples of New Orleans and Pernambuco cotton, &c., are contributed by P. Hughes (74 A & B, p. 981), from Anna Regins Plantation, Essequibo: for these samples Honourable Mention was awarded.

An excellent specimen of uncleaned short staple cotton from the Klein Poudcroyen Plantation, river Demerara, is exhibited by A. D. Van der Gon Nettener (73, p. 981): this was deemed worthy of a Prize Medal.

A good sample of New Orleans cotton grown at Blacknow, Jamaica, by W. Finlatson (163, p. 987), was decided

worthy of Houourable Mention, wortay of mosourame mention. A remarkably fine specimen of Sea Island cotton is shown in the Prinidad collection. The seeds were imported from Jamaica; the produce is excellent, has a beautiful silky lastre, and is strong; it was considered worthy of Honourable Mention.

Some long, and strong, but rather coarse cotton is shown by the AGRICULTURAL SOCIETY OF ST. HELENA (2,

p. 955); it is in a tolerably elean condition.
Samples of cotton from Maitland, in New South Wales.

are contributed by Messrs. Dungzon (11, p. 989).

The collection of loog staple cottons from the United States is, as has already been mentioned, remarkably fine. The samples leave nothing to be desired, either as to examination of all the bales, the Jory being desirous of expressing their high appreciation of the degree of per-fection to which the entitivation of this important staple has been brought in the United States, decided on recommending the award of the Council Medal to the Govern-ment of the United States (p. 1431), io testimony of the great and successful efforts made by the cotton planters of that country (see p. 69); whilst at the same time they determined to award a Prize Medal to each of the eleven following exhibitors, without attempting to draw any distinctions :-

S. BOND, of Memphis (37, pp. 1434, 1435). W. Hampton, of Charleston, S. Carolina (172 n, p. 1448)

G. L. Holmes, of Memphis, Tenemee (316, p. 1454). Lonis Prolific. J. V. Jones, of Charleston, S. Carolina (172, p. 1448). J. R. JONES, of Charleston, S. Carolina (172A, p. 1448), D. Las, of Memphis, Tenessee (530, p. 1456).

W. W. M'CLEOD, of Charleston, S. Carolina (172g, p. J. B. MERRIWEATHER, of Montgomery, Alabama (164, p.

320n, p. 1454).
An instructive collection of small samples of cotton is contributed by TRUESDALE, JACONS and Co., of New York (494, p. 1465); this, and also the collection of ELI RAYNER. of Tenessee, were deemed worthy of Honourable Mention.
A fine sample of long staple Peruvian cotton, of a good

and useful character, is exhibited. Specimens of uncleaned Chinese cotton, "Meenhwa, and the same cleaned, "Hwac," are contributed by H. M CONSUL at SHANGHAE (1, p. 1418); the cotton has a good colour, and a fine silky instre, but it is so short that it could only be used for wadding, or to mix with other

cottons; it is very well eleaned, Several good samples of cotton are shown in the Egyptian collection; of these the Mako cotton, first qual exhibited by ABBAS PASHA (106, p. 1409); the Sen Island cotton, grown by T. W. Lankine (134, p. 1409), were deemed worthy of Honourable Meution.

Some interesting and promising samples of cotton are

contributed from Algeria, demonstrating to a remarkable manner the progress being made in that colony; among these, in particular, may be specified the capital Louisiana cotton from M. Chuffart, of Birmandress (17, p. 1260); the Jumel cotton from DUPRÉ de ST. MAUR of ORBAL, Oran (23, p. 1261); the elean, long, and useful Jumel cotton of 1850, from Monts of EL Bian (39, p. 1261); and the strong, fine, and well-eleaned cotton from C. Pelissien of Kaddous (42, p. 1261): for each of these four, the Jury awarded a Prize Medal.

The collection of cottons contributed by A. Handy, manager of the Hamma Nursery near Algiers (28, p. 1261), is also remarkably good; including Georgia, Louisiana, Jumel, New York, Macedouia, and Nankeen cotton of 1849 and 1850; for this the Jury awarded a Prize Medal.

Medal.

Other fair samples of cotton are contributed by F.
Garna of Philippeville, Constantine (26); Halocan of
Drariah (27, p. 1261); and M. Benes (6, p. 1259); these
were deemed worthy of Honourable Mention.

Good cotton entitivated near Lisbon is contributed by A. Sa. Noutreian, 4389, p. 1313; this was deemed worthy of Hocourable Mention. (359) and (340) are good Brazilian cottons from Algarve; they have a long and strong fibre, but are a little coarse and wild.

In the Russian collection there are two samples of cotton: Bourbon cotton, exhibited by Panyer, Nato Dispayanza, from Imeritia (95, p. 1869); and native cotton from the district of Staroor, government of Erivan, cultivated by Annocaza-Manan Guai (94, p. 1899). These were both considered worthy of Honourable Mention.

eultivated by Andourza-Manan Gels (94, p. 1369). These were both considered worthy of Honourable Mention. A fine sample of cotton is shown by M. Hurrell (1428), from the Society Islands, which was deemed worthy of Honourable Mention.

Raw cotton, the produce of the province of Seville, 1 nised from Sea Island seed on irrigated lands, is exhibited by J. B. VILLARS of Seville (162, p. 1339); it has n fine, long, and strong staple, of a very useful character, and was therefore doesned worthy of Honourishic Mention.

A valuable and increming series of samples of estimations in the Trians Chazarry or for produce from these orders are the Trians Chazarry or for produce from these orders is destroyed as a stage, and that preclaim these colous is destroyed as a stage of the triangle of any order of the triangle of the triangle of the triangle of any order of the triangle of the

PLAN AND HEMP.

The quantity of flax imported into Great Britain has, for a considerable number of years, been gradually increasing. Twenty years ago the annual importation was about 48,000 tons; ten years since it had increased to about 63,000 tons; and not the present time it is about 63,000 tons; and not the present time it is about 60,000 tons; and the present time it is about 60,000 tons; and the present time it is about 60,000 tons; and the present time in the present time in the present time in the present time in the present time is the present time in the present time in the present time in the present time is the present time in the present time in the present time in the present time is the present time in the present time in the present time in the present time is the present time in the present time in the present time in the present time in the present time is the present time in the present tim

Dering the last few years, great efforts have been under to extend and improve the manufactors of this valuable flew in various parts of the world. The increase under the last heads in the preceding tube, for 1849, is closely due to the impratision of flax from Egypt. It must be remembered that, in addition to the above-neutroned quantity of flax annually imported, the manufacturers of England have cuttivated in various parts of the Entitle capture, choicing in Ireland. This proportion has also emoletally in Ireland. This proportion has also emoletally in Ireland. This proportion has also emoletally in Ireland.

improvement in the quality of the flux itself has also been produced; a change in great inseasor to be traced to the preserveing and most prolecutrity efforts of the Plax in Ireland. The value of flux depress, in part, and the client and soil in which it is cultivated; and in part, also, on the note in which the five is prepared, on the clients and soil in which it is cultivated; and in part, also, on the note in which the five is prepared, on the contrast and vigilant attention which is paid to it it through the virsues stages of the operation. According to its quality, its value varies from about 4th, to 18th, per 10th.

Another circumstance which has given a considerable presents to the cultivation of flax, and is likely to produce, ere long, even yet more marked effects, is the introduction of the late R, B, Schenck's new process of steening.

Formerly the separation of the fibre from the woody untter of the stem was effected by the process of " re of which there were three modifications-dewretting, pond-retting, and river-retting. The stem of the plant consists, essentially, of twn parts :- a wooden centre or core, the sloce or boon, - and the external fibrous portion, which, when separated from the farmer, con-stitutes the flux. These two are cemented together by a glutinous matter, not soluble in water alone, and wh must be got rid of by some means before the pure fibre can be separated from the woody shove. The old mode consisted, merely, in exposing the flax stems to air and muisture under circumstances favourable to fermentation or incipiest purrefaction, so that the gininous matter being destroyed, the fibre could then be easily separated from the shove. Whether this species of fermentation is effected by exposing the flax for some weeks to the action of the dew and rain, spread over meadowswhether it is effected by steeping it in ponds or pits of stagnant water—or, lastly, by sinking it in large wooden frames in the current of a deep and slow-flawing river; there are serious practical difficulties, which have long directed the attention of ingenious men to the possibility of discovering a new and less objectionable mode of pre-During the slow retting of the flax a large paring fax. During the slow retting of the flax a large quantity of certain putrid vapours is given off; the water, and the very air itself, are possoned; and this, alone, is no trifling objection to the process. So serious an objection, indeed, have these patrid exhalations been found to the use of water-retting, that in some districts of Belgium, in Hainault and Namur especially, it is forbidden by law, as being dangerous to "public safety and the health of the inhabitants." In Flanders, however, no such laws are in force, and it is there commonly believed that dew-retted flax is, of necessity, mengre and dry. Many different modifications and peculiar modes of retting are followed in the various flax districts of Belginm, Holland, and France; and in different localities dissimilar modes of retting have long been in use, often involving very considerable variations in principle. at Courtrai, the flax crop is dried in the field and stored for some months in barns, before it undergoes the process of retting in the river Lys. In the district of Waes, it is retted immediately after being gathered, the green stems being at once thrown into pits of stagnant water, As, however, the whole operation, in every kind of waterretting, depends on the amount of fermentation pro duced (which must be enough to insure the decomposition of the glutinous matter, but not enough to cause any injury to the fibre), the process is necessarily slow. tedions, and very nucertain, especially towards the close of the operation, because then, the flax must be most carefully watched, in order to put a stop to the fermen-tation as soon as the desired effect is produced. A slight change of temperature, or a few hours' exposure, when the fermentation in complete, may produce the most disastrious effects, the fibre being in fact ruined. Dewretting is of course even slower than water-retting; depending, as it necessarily does, on the nature of the season, and being greatly returded by long-continued dry weather. In the very dry antumn of 1810, it was found impossible to prepare flax by this method, and recnurse was abliged to be had to other methods of retting.

During the last half-century various attempts have salt of sorrel was used for the some purpose; nod in 1775, been made to effect the separation of the fibrous from the woody portion of the flax stem by chemical and memeans. In several cases the resolts at first appeared to be very promising, but to every instance it was soon found that there were insuperable practical objections, which more than counterbulanced the advantages. Among chemical agents, solutions of sulphuric acid, caustic potash, caustic soda, quicklime, and soft soap, were all, in turn, tried and discarded; and among mechanical processes the ingenious contrivances of Mr. James Lee and Messes. Hill and Bundy shared the same fate. Mr. Lee, having found a means of separating the fibre of flax without water-retting, and the discovery being considered one of very great importance, obtained a patent for his mechanical process in 1812, with the singular protection of a special Act of Parliament, by virtue of which he was exempted from specifying the particulars of his process during the first seven years of the duration of his patent. In 1817, and therefore before the publication of his specification, Messrs. Hill and Bundy took out their patent for machinery for hreaking and preparing raw flax and bemp. The rival claims of these two inventors were investigated in 1817 by a committee of the House of Commons; but whatever may have been the comparative merit of the two processes, in the course of a very few years both were relinquished and forgotten. Since that time various other ingenious mechanical arrangements have been devised, but hitherto they have had very little success.

Schenck's process, for which he obtained a patent in 1846, is undoubtedly a very important impowement; it consists merely in steeping the flax stems in warm water, heated artificially to the temperature best suited to fermentation. By this simple means, the operation is rendered rapid and certain, all uncertainty from fluctuations in the temperature and weather is avoided, and the whole process is entirely under the command of the manufacturer. The temperature best soited for this purpose is about 80°, or from 80° to nearly 90°; above this point the process proceeds too rapidly, and the fibre is almost sure to be more or less injured. The time required is from about 70 to 90 hours.

From the faets and evidence brought forward by various independent exhibitors, it appears satisfactorily proved that the warm-water steeping increases the percentage of fibre obtained from the flax stem over that obtained by the old modes of retting by nearly one-fifth; and that, whilst the fineness and spinning qualities of the fibre are increased, the strength is in no way weakened or diminished, unless the process be permitted to proceed too far, an effect which need never happen, from the complete control over it which the manufacturer has throughout. Although there is no doubt as to the practical value of the use of warm water in flax-retting, yet the introduction of Schenck's process is far from removing all the difficulties of the flax manufacture; much still remains to be effected, and it is hy no means improbable that, ere long, a yet more perfect process may be devised.

It is interesting to observe that the use of warm water

in the preparation of vegetable fibre is not altogether new, it having been long employed by the Malays, and by the natives of Rangpoor, in Rengal. The process adopted at Bencoolen is stated by Dr. Campbell to conslat in steeping the stems of the bemp in warm water, in which it is allowed to remain for two days and nights

The old German process called " Molkcorost," times used in preparing the finer sorts of flax, is also, to some extent, ao application of the same principle. this mode of retting, the flax was steeped for four or five days in n warm mixture of milk and water, and thus the desired degree of fermentation in the flax stems was produced. This operation must be distinguished from the more modern one, in which sour milk was used in the more mouern one, in which some make was used in order to give a good colour to linen, a process introduced by the Dutch towards the middle of the last century. The linen was boiled in a weak alkaline lye, and subsequently treated with sour batternilk, for the purpose of aiding in removing the alkali, and dissolving the earthy impurities present in the fibre. Occasionally, also,

Reuss states, that sulphuric and murintic acids might be used for the same purpose; but that being too costly, they had not as yet come into general use. Of course, all processes in which boiling or even hot water is used are quite different in their mode of action from those in When boiling which only warm water is employed. water is used, it is with a view of dissolving and removing the uscless untters which enerust the fibrous part of the plant; whilst, on the other hand, warm water is used to soften them, and to aid in their putrefaction or decomposition, through the ageocy of fermentation 1787, much interest was excited in Ireland by the publication of a plan for improving the retting of flax by the action of hot water; in this scheme, it was proposed to scald the flax-stems in boiling water to soften them, and to remove a portion of the extraneous vegetable matters which they contain; and it was conceived that after this treatment the subsequent retting of the flux would be more rapid, certain, and manageable; so that time woold be saved, the noisome process of pond-retting be obviated and the result be to yield a stronger and whiter fibre. The minute and careful experiments of Hermbstaedt, on the chemical principles involved in the retting of flax (made about the beginning of the present century), threw much light on the whole subject, and to some extent in-dicated the influence of temperature on the success of the operation.

The entire collection shown by the "Royal Society for Improving and Promoting the Growth of Flax in Irelaud" (106, p. 203*) is so highly valuable, and so clearly illustrates the great advances which have already been made in these matters, and the important service which this society has already rendered to the country, that the Jury determined to mark their high appreciation of the Society's labours by the recommending the Conneil Medal. (See p. 69.) Among the individual specimens of particular merit may be mentioned the flax exhibited by Wattra, of Antrim, Prezros, of Belfast, and Adams, of Ballyderitt, near Coleraine (48, p. 198*): to each of these three the Jary awarded a Prize Medal.

A very useful and complete series of the principal commercial varieties of flax, hemp, and similar fibrous materials, commonly net with in the English market, is contributed by Messrs. Hurchitson (40, p. 197*). The samples, which are all good, are as fullows :--

For this collection the Jury awarded a Prize Medal. A numerous series of specimens are contributed by P.
CLAISHEM (105, p. 202*, 203*), in illustration of his patent process of making flax cotton. This process (patented August 1850) consists essentially in boiling the cut and crushed stems of the flax, hemp, or other plant, in a dilute solution of caustic soda, containing about one two-thousandth part of alkali. The fibrons matter is then removed, and plunged into a bath of dilute sulphuric acid, containing one five-handredth part of seid, in which it is boiled for about an hour. It is next transferred into a solution containing about ten per cent, of carbonate of sodn; and lastly, when it has remained in the latter for an hour, it is planged into a weak solution of sulpharie acid, consisting of one part of scid to two hundred or five hundred parts of water; in this it is left for about half The effect of an hour, and the process is completed. an hour, and the process is completed. The these several processes is "to divide and split up " the fibre io a most remarkable manner, so as completely to alter its character. Flax thus treated is converted into a substance very nearly resembling cotton. It is probable that flax cotton can be advantageously used in the manufacture of mixed fabries, as it appears capable of being span with wool, silk, and other fibres. It may, therefore, perbaps hereafter lead to several new and important practical applications. For this ingenious process the Jury awarded a Prize Medal.

The idea of modifying the fibre of flax and hemp, so as to convert it into a kind of cotton is by no means new. as to convert it into a kied of cotton is by no means new. In 1747, Lillikireazes and Palmquist described a mode of converting flax into "cotton" by boiling it for some time in a solution of caussite potash, and subsequently washing it with sonp. In 1775, considerable quantities of refuse flax and hemp were converted into "flax-cotton" by Lady Moirn, with the aid of T. B. Bailey, of Hope, near Manchester. The full details of the process employed do not appear to have been published; but from Lady Moira's letters in the "Transactions of the Society of Arts for 1775," it appears that the fibre was boiled in an alkaline lye, or a solution of kelp con-taining carbonate of sods, and subsequently scoured. The result of this was, that "the fibres seem to be set at liberty from each other," after which it may be "carded on cotton cards." It appears that at this simulations "carded on cotton cards." It appears that at this time
"flax cotton" was made and sold at threepence a pound; and Lady Moira states that she believes that it takes colours better than flax. It is curious to observe the fate of Lady Moira's scheme: she says, "I have no reason to be vain of the samples I have sent you, they merely show that the material of flax cotton, in able hands, will bear manufacturing, though it is my ill fornames, will bear inautificturing, though it is my it it-time to have it discredited by the artisans who work for me. I had in Dublin, with great difficulty, a gown wore for myself, and three waisteens; but had not the person who employed a weaver for me particularly wished to oblige me, I could not have got it accomwhere to beinge me, a count not cave got it accords
plished; and the getting spun of an ounce of this cotton
in Diblin I found impracticable; and the absurd alarm
that it might iojure the trade of foreign cotton had
gained ground, and the spinners, for what reason I cannot comprehend, declared themselves such bitter enemies not comprehend, declared themselves such bitter enemies to my scheme, that they would not spin for me. Such is my fate, that what between party in the metropolis and indolesce in this place (Ballynahyuch), I am not capable of doing my scheme justice. That it should ever injure the trade of foreign eutton is impossible. Though long accustomed to behold shore and stockings looked upon in this part of the world by the generality as quite unnecessary, yet I cannot think but some apparel is re-quisite: and as the price of wool is so high, and the poverty of the prople so great, I did wish to introduce amongst them that invention which I saw might be greatly improved, and turn the refuse of flax into comfortable clothing, and by a process so easy that every industrious wife and child might prepare it." Lady Moira states, that the flax-cotton gowns which she had had made, and which were worn by the members of her own family, were exceedingly durable; and the specimens of these fabries, as well as of the flax-cotton prepared by her, which are still preserved in the Museum of the Society of Arts, &c., are bigbly remarkable for their beanty.

Subsequently to this, several attempts were make in Emergency to cover the line in the first confidence of the Community of t

introduction of flaccotton, for Flockmans, who peaks in the man of in manufacture uses Processed, since that has been of in manufacture uses Processed, since that has been described by the same flushes and the same flushes and the same flushes the described by the same flushes the described by the same flushes the description is not been reasonabled to the contract to coolinary center is also remarked before it in cardo, it is not probable to distinguish it from coston, either in its new state or when manufactures of the same flushes to the contract of the same flushes and the same flushes the flushes and the same flushes who can be placed attenuably resempts in hot obtains of one, placed the same flushes who can be same flushes and the same flushes are same flushes who can be same flushes and the same flushes are same flushes.

monest refuse tow, as from the lest flax.

A good sample of well-prepared flax is exhibited by
Messrs, Caron and Nelson (46, p. 198*). It is shown not
on account of superiority of fibre, but as a specime
of manipulation and treatment; it is very creditable, and
was deemed worthy of Honourable Meution.

Some good samples of flax are exhibited by G. Mazow (34, p. 1997): they are, 1st, flax grown, steeped, and scutched at Yately, North Ilaots, flax grown in South grown at Embedding and the grown at Embedding and the grown at Embeddency fl. There are likewise samples of flax scutched at Winchester County Gasd, and several specimens of tow; and the whole is illustrated by a series of models of the tools and implements used in the period of models of the tools and implements are in the grown of models of the tools and implements are discussed in the contract of the series when the contract of the series are the series of models of the tools and implements used in the series of models of the series and the series of the series are the series of the seri

Some excellent specimens of yellow flax, grown as frimmingham, in Norfolb, by Mr Wakassa, and some blue flax grown in Yorkshive, as well as some of the bibliotic and contrasted, both in the raw and partly manifectured states, by Messrs. Hivra and Araxisos, of Leeds (4, b, 189-). For gree very crediable, and fully en-Excellent Courtrail flax is also exhibited, for best quantity and faith, by Messrs. Mansanal, of Leeds (55, 1900) and faith, by Messrs. Mansanal, of Leeds (55, 1900) and faith, by Messrs. Mansanal, of Leeds (55, 1900) and faith, by Messrs. Mansanal, of Leeds (55, 1900) and faith, by Messrs. Mansanal, of Leeds (55, 1900) and faith, by Messrs. Mansanal, of Leeds (55, 1900) and faith, by Messrs. Hity and finish, by Messix. Marshall, of Leeds (55, p. 199*); these also are well entitled to Honourable Mention. (See p. 101). An interesting series of samples of flux, prepared by mechanical means alone, is exhibited by M. J. J. DONLAN

(40, p. 1974, 1997).

(40, p. 1974, 1997).

(40, p. 1974, 1997).

(41) the second of t

Dinnington, are excellent.

Some good samples of hemp, accompanied by cloth
manifectured from it io the Himalayas, are shown in
the valuable collection of East Indian fibres.

Samples of Canadian flax are exhibited by M. Barriex, of St. Rise (70, p. 963), and of hemp, by F. Garcz, of Montreal (71, p. 963). In both cases the quality of the fibre is good, but its preparation is faulty and objectionable; with a little more care the value of each would be considerably insereased: they were both deemed worthy of Honourable Mention.

A good specimen of flax from Van Diemen's Land is exhibited by J. Dixon, of Skelton Castle, Isia (19, p. 99), and by F. Lirpcontm: (14, p. 995): these were both deemed worthy of Humonrable Mention.

A few small samples of flax and hemp from the United States are contributed by E. R. Dix, of Vernon, New

York (139, p. 1441). They are of fair average quality, but

Awarded a Prize Medal by Jury of Class XtV.

not remarkably fine; they were, however, deemed worthy of Honourable Mention,

Fine samples of strong and well-prepared flax are shown from the FLAX SPINNING MILLS of Schöuberg, in Moravia (95A, p. 1012), by Jacon Binsmat's (95, p. 1612), and FLAX-RETTING ESTABLISHMENT AT UIfrom the PATENT lersdorf, also in Moravia (96, p. 1012), the latter including raw flax-the same water-retted-and heckled flax. A Prize Medal was awarded to each of these three series.

The samples of Belgian flax are, as might be expected, excellent, and well sustain the high and acknowledged reputation which it has long enjoyed. Several of the specimens shown are remarkably strong, fine, and mellow. In particular, the Jury would specify the flax shown by DAYID and Dr. Bon, of Autwerp (98, p. 1154); DESMEDT and Co., of East Flanders (104, p. 1154); J. B. VAN BOGAERT, of Grimbergen, in East Flanders (107 p. 1134), who also shows some excellent hemp. P. J. Vernerex, of Grimbergen (113, p. 1154), and J. B. Van Wille, also of Grimbergen, in East Flanders (114, p. 1154), who contributes pond-retted flux of 1850. To each of

these five the Jury awarded a Prize Medal.

Fine samples of flax are also exhibited by DEGRASTE-DELFOATRAIR, of Ghelueve, West Flanders (90, p. 1154); F. LECLERCQ, of Lougehamp, Namur (88, p. 1154); F. VERCRUSSE, of Dewbyck, near Courtral; and J. C. VAN ACKERE, * of Wevelghem, in West Flanders (215, p. 1154-1158); these were deemed worthy of Honournhie Mention. Several good specimens of flax in its various stages of preparation are likewise contributed by Rokes and Co., of Lokerea (83, p. 1154); Dr. M. LAVIOLETTE, of Bruges (96, p. 1154); S. P. Van Hoev, of Hamme, in East Flanders (106, p. 1453); B. Haker, of West Flanders (115, p. 1154);

and by the FLAX COMPANY OF GHENT (230). Among the samples of Belgiau hemp, those of F. Vzn-Among the samples of beignan neuro, those or 2. Figure 7. Relater, of Grimbergen, in East Flanders (102, p. 1159); Pizanz Jrax V Jan Kirt, of Moerzeke, in East Flanders (103, p. 1154); and J. L. Gurta, of Appels, in East Flanders (105, p. 1154), were deemed the best: the Jury awarded a Prize Medal to each of these three.

In the EGYPTIAN COLLECTION of mw produce, several recimens of first and hemp are shows. The first of Facum (107, p. 1409), that from Mensuf (108, p. 1409),

and the sample of hemp (152, p. 1469), were deemed worthy of Honourable Mention. Very superior flax and hemp are contributed by some French exhibitors, especially from the Northern Departments. Among the exhibitors of flax may be specified ments. Among the exhibitors of flax may be specified L. Detwontrae, of Bourbecque, near Lills (177, p. 1182), who shows flax of the year 1849, retted in the river Lys. P. Roczez, of St. Brieux (362, p. 1171; Journaux Boxxanar, and Co., of Angers (552, p. 1205), who also show excellent hemp; and E. H. Latitazza (559, p. 1205); to each of these four, severally, the Jury awarded a Prize

Among the French exhibitors of hemp, those deserving Among the French Various of nemps, the School of special notice are Messrs. Bennand, Richork, and General, of Angers (61, p. 1174). Laine Labouer, and Max-Richards, of Angers (286, p. 1190); and Lattlese Brottiers, also of Angers (576, p. 1205); to each of the state of the Angers (576, p. 1205); to each of the state of the Angers (576, p. 1205). these three the Jury awarded Prize Medals.

In the Zollverein collection, the samples particularly deserving notice are those shown by A. RUYIN, of Rüstern, Liegnitz (34, p. 1049), specimens of flax swingled in the Belgian method, by the Baron von LETTWITE. of Simmenau, near Ippeln (42, p. 1050); and G. Me-vissen, of Dülken, near Düsseldorf (557, p. 1082); to these three the Jury awarded Prize Medals

The samples of flax contributed by E. F. ELERENDORF,* of Isselhorst, near Bielefield (470, p. 1078); Könics and REKELERA, of Dilken, nesr Disseldorf (532, p. 1081); A. BRUENGER, of Jöllenbeck, near Bielefield (539, p. 1081); 1082); and C. E. Honnio, of Brunswick (722, p. 1090); and P. OLLENDISSEN, of Urentrup, nesr Bielefield (531, p. 1081); were severally deemed worthy of Honomrable Mention. A good sample of hemp is exhibited by the Landwinter-

SCHAFTLICHER VEREIN, at Sangerhansen.

* Awarded also by Jory of Class XIV.

Some samples of well-prepared flax are also exhibited from Saxony: those exhibited by C. Sonner, of Sorner, near Mügen (1, p. 1104), J. WATTEVNE, of Lichtenburg, near Freihurg (2, p. 1104), and W. GAETZICHNANN, of Zittau (3, p. 1104), were deemed worthy of Housirable Mention.

Specimens of flax and heup prepared in a peculiar man-uer, are shown by S. L. Swaan, of the Hague (50, p. 1145). In the Portuguese collection, there are several sp of both flax and hemp. The hemp from Catharia, exhibited hy the Duke DE PALNELLA (530, Class I. and II., p. 1550), shown both in the state of dried stems and partially dressed, was deemed worthy of Honourable Meution.

Several specimens of flax and hemp from Rome are Several specimens of flax and hemp from Rome are also shown. A sample of Centees hemp, contributed by the Chamber of Conneases of the city of Cento (9, p. 1285), was deemed worthy of Honourable Mention. Hemp in also exhibited from Bologna, by the COLYMPRANCONCIN (4, p. 1285), and by MARCY MINCHITTI

BIANCONCINI (4, p. 1250), and by Marcy MINCHISTI (10, p. 1253). A large and important series of flux and hemp samples is shown in the Russian collection of raw produce, and several of them are capital specimens. The flux is in considerable variety—from fine and sillty, down to course and wiry; some of the specimens are a little unequal and irregular. Among the best many be mentioned those of ANDARATERY BROTHERS, from the government and district of Novgorod (99, p. 1069); E. Kannoviron, from the government of Jaroslaff (101, p. 1367); and those from Valk, in the district of Vissk, government of Esthonia (106, p. 1369); some of the latter, in particular, are especially fine. The Jury awarded Prize Medials for these three.

these three cellent far is also exhibited by Merunci BRARRENT (Kholen, in the government of Peruncia (96, p. 1569); from the Fark or Gostoomrax, in the government of Mediled (214, p. 1370); Chaura, Mon-Moria (1988); and the second of the contract of the S. Zakasacory, of Kholen, in the government of Phica, (108, p. 1370); and Kowai Minnonstructure, of Podjoi (110, p. 1370). The samples from these five exhibitors were deceased worth of Honourish Medician.

Good specimens of flax are also contributed by JOHN and THEODORE ARBAMATSKY, of Soletz, in the governand I REDDOME ALLAMATERY, of Solett, in the government of Pakes, [47, p. 1309; John Ardamatery, of Porkos, in the government of Pakes, [36, p. 1369); MELNEGF, of Melcakos, in the government of Vladinis, (111, p. 1370). Theodome Vanishoff, of Solett, government of Pakes (112, p. 1370); and the Verlino Estate, in the government of Jaroslass (105, p. 1369).

in the government of Jaroolaff (105, p. 1369).
Of the samples of Rossian hemp, the best are those
exhibited by Kasserkxxxxxvr, from the district of
sevel, government of Orel (100, p. 1369); Kossar Etzksassory, of Elisk, government of Jaroolaff (103, p. 1369);
and the Parsker Volkrassky, from the district of Serok,
government of Orel (108, p. 1370). For each of these
three series a Prize Medal was awarded by the Jury. Very good samples of flax and hemp are exhibited it the Spanish Department of raw produce; among the best are the fiax contributed by F. A. Vallowa, of Cacabetos, Leou (98, pp. 1334, 1335); the Province or Huesca (158, 1339); and by P. De Las Itemas, or caporal land. These were severally deemed worthy of Honor and by P. De Las Henas, of Segovin (161, p.

Good specimens of flax are also contributed by J. M Caldenox, of Grennela (152, p. 1338); J. Piyan, of Leon (159, p. 1339); fiax from Calateras, and Vega de Monasterios, by Dr. Las Heras, of Zamora (91, p. 1339); fiax from Camarram, and Poebla de Sanabria (91, p. 1334); and by DE Las HERAS, of Saragossa; flax from

able Meation

1339); 360 by De LES TERRAS, OF CHERGONS, OR ACCOUNT OF THE BOY'S DE LA STREAM, OF CHERGON, OF GRENDA (152, p. 1338); P. MARTINEZ, OF Valencia (156, p. 1339); and by COURT RIFALDS, from Valencia (163, p. 1339). For each of the Court of the nipalda, from valencia (163, p. 1339). For each of these three samples, the Jury awarded a Prize Medal.

A very excellent specimen of strang, though somewhat coarse hemp, is also shown by A. Diez De Ribera, of Grenada, (172, p. 1339); this was deemed worthy of Hononrahle Meution.

Samples of hemp are contributed likewise by the Municipal Corporation of Castellon (153, p. 1338); D. Ds.—, of Murcia (154, p. 1338); D. DE.—, of

Saragossa (155, p. 1338). Some interesting samples of water-retted flax from Angermaland, in the north of Sweden, are exhibited by Johan Johanson (21, p. 1350). The flax is of very good quality, though not well manufactured; it was owever deemed worthy of Honourable Mention, In the Turkish collection, six samples of flax and two

nf hemp are exhibited; the latter are from Djanik, and Wallschia; the former from Endemith, Djanik, Unia, Aidin, Drama, and Wallachia.

MISCELLANE ES FIBRES.

In the various collections of raw produce, a very large number of other fibrous substances, used as substitutes for cotton, flax, and hemp, are shown; some of these are new or but little known, and among them are several which, from their valuable properties, seen likely, ere long, to become important articles of trade, and not merely to form excellent substitutes for the substances already employed by unnunfacturers, but even in some cases to

lead to the development of new branches of industry An interesting series of hemp, flax, and other fibrous substances is contained in the Liverpool collection of imports, these include-

Samples of flax from Holland, Belgium, France, and Russia are shown in the Hull collection of imports, and the quantity of flax imported annually is stated to be 310,000 ewts, Specimens of hemp are exhibited also from Prustin and Italy, the yearly import of which is about 55,000 cwts.; and samples of East Indian hemp, Manilla hemp, and jute; of the latter, about 1,100 cwts. are annually imported.

Amongst fibrous materials, one of the most interesting is the "China-grass," of which numerous specimens are exhibited in various departments of the Building, some of the most complete and valuable series being in the

English Gallery Although China-grass fibre is comparatively a new material in the hands of our manufacturers, yet it has been known to men of science for a very considerable time; but certain practical difficulties have hitherto prevented it from being usefully and profitably employed. China-grass fibre is obtained from Urtica sives, abundant in China and in various parts of the Indian empire, where it has long been used by the natives, who, by the simple maceration of the plants, obtain from them a strong and very useful fibre. Of the various fibres examined by Dr. Roxhurgh, at the commencement of the present century with a view to the discovery of some cheap and good with a view to the discovery of some cheap and good substitute for heum, one of the most promising was the "Callooce" hemp, "Kankhura," or the "Ramy," of the Islands and Malay penisusla. This he found to be the produce of an Urtica, to which he gave the name of U. tenezissina. The plant was introduced in 1803, from Bencoolen to Calcutta, where it was cultivated for several years in the Botanic Garden, then under the charge of Dr. Roxburgh. A considerable quantity of Callooce hemp having been imported into England in 1814, its practical value was tested by some competent authorities; and as the reports were highly favourable as to its strength and other valuable qualities, the Society for the Encouragement of Arts and Manufactures awarded a silver medal to Captain Joseph Cotton, of the East India Company, for

its introduction. The chief obstacle which interfered. however, with its use, was the difficulty which was found to exist in the preparation of the fibre from the stems of the plants; none of the processes usually adopted with flax or bemp were found to be at all suitable to them; and the rude, wasteful, and imperfect means employed by the natives in preparing the fibre for the manufacture of twine, thread, and fishing-nets, by the mere process of scraping, were wholly imapplicable on a large scale, and gave, besides, only a very interior result. When manufacture of the manufacture of the manufacture of the manufacture and the manufacture and the manufacture of the manufacture and the manufacture of the cerated or retted in water, it was found that the fibre itself was more easily destroyed than the glutinous mat-ter of the stem. It was hoped that the introduction of the machines of Mr. Lee, and of Messrs. Hill and Bundy, already referred to (see p. 97), would have obviated this difficulty; but such did not prove to be the case.

During the last farty years, various attempts have been ade to devise a good and cheap process for preparing this fibre, but hitherto without much success; and con sequently, till quite recently, the cost of the fibre was such as to preclude its being brought into the market as n as to precing the length of th obtained, in almost unlimited quantities, in various parts of India; and a process, which has lately been patented appears, to a very great extent, to have removed the practical difficulties which previously stood in the way of its employment by manufacturers; so that in a few years it is probable that the Callooce bemp will constitute an important addition to the fibrous materials employed in the arts. The process of Messrs. L. W. WRIGHT and Co., for the

paration of China-grass, &c., for which a patent was obtained in 1849, consists, essentially, in a very ingenious arrangement for boiling the stems in an alkaline solution, after they have previously been steeped for 24 hours in cold water, and for 24 hours in water of a temperature of 90°. The fibre is then thoroughly washed with pure water, and finally subjected to the action of a current of

series of specimens illustrating the preparation of this fibre, the various stages of the process, the bleaching of it, and the uses to which it may be applied, both alone and in conjunction with other fibrous naterials in the forma-tion of mixed fabrics, is shown by Messrs. WRIGHT (42, p. 197*). For these the Jury awarded a Prize Medal. Very beautiful samples of Chiua-grass fibre are like-wise shown by Messrs. Htvss and Atkinson* (45, p.

198"), already mentioned as exhibiting superior sample of flax. For these two series the Jury awarded a Prize Medal.

Equally fine specimens are exhibited by Messrs, Manshall and Co.," of Leeds (55, p. 199"), whose samples of flax have already been alluded to. For these samples also the Jary awarded a Prize Medal.

A valuable and instructive series of samples of New Zealand flux is contributed by E. W. Tsent (41, p 197*), in illustration of its manufacture and uses. It is stated that the flax is prepared from the leaves of the Phormium tenar, without muy process of steeping, and by a simple mechanical process, which the exhibitor suggests might be advantageously carried on in New Zealand itself. This series was deemed worthy of Hunnurable Mention,

Some interesting specimens, showing the native manufacture of New Zealand flax, are likewise exhibited by Tao Nvt, a New Zealand chief (44, p. 198*). The flax is prepared for weaving, by soaking it for two days in water, twisting it into hanks, and then beating it with a mallet on a stane. This series was deemed worthy of Honourable Mention

Honourable Mention.
Good specimens of eccoa-sust fibre are shown in illustration of the various purposes to which it is now extensively applied, by J. Bassaus (5c, p. 199*), and by Wilhert and Co. (Class XXVIII, 40, p. 780). In this department of raw produce, as in most others, the East Indian collection is peculiarly rich,—very learning the contraction of the produce of the contraction of

(pp. 382-384). The old investigations of Dr. Raxburgh, in se beginning of the present century, already referred to, are of much importance in counexion with this subject; and it is remarkable that though the value of some of these Indian fibres was well known to him, and that he repeatedly sent samples of them to this country, they have pever received that attention from practical men which they certainly deserved, with the exception of one or two that have long since became considerable articles of import. Of these, we may instance the jute, the fibre of the Corchorus capsularis, and C. olitorius, of which, as has just been stated, more than ten thousand tons are annually imported into Liverpool alone. The following Table shows the comparative strength of several of these East Iudian fibres, as ascertained by Dr. Roxburgh; but it must be borne in mind, that, in several instances, the fibres had evidently been very rudely and imperfectly prepared: the experiments were made in 1804.

nf several of which were as follows :--

It is plain that the strength of all these fibres was ascertained under very unfavourable circumstances, and there is no doubt that they would have been found even yet more valuable had they leen well and properly prepared. The principal vegetable fibres contributed from India are the following:—

a are the following:-"Callooce," "Rhea," or "China-grass," the fibre of Urtica tenacissima, and one or two other varieties of Crtica, already mentioned as well known in commerce under the name of "China-grass." Strictly speaking, it under the name of " China-grass." Striedly speaking, it is probable thut China-grass and Callooce hemp, are the produce of twu distinct species of Urtica, though the fiber of the two is very similar, and, for all practical purposes, to fact identical. China-grass, as it is most commonly called, is the preduce of the Urtica (Backseria). monly called, is the produce of the Urtica (Backseriu) asieve of Wildelmow, whist the Calloope, Kalmoi, or Ram of Sunaarm, is obtained from the Urtica (Backseria) tenescission of Rokburgh. It is from this latter plant, also, that the Rhea of Assam is procured. The plants yield the product of the plants of the capting his beautiful fibre are very abundant in many parts of the empire, and may be had in almost unlimited. quantities. In the form of hemp, and when the fibre is well prepared, it is remarkably strong, and when tho-roughly bleached, though the strength is then somewhat diminished, it acquires a most remarkably beautiful white silky lustre. Various specimens of this fibre are contri-buted from different parts of India; from Calcuta; from Assam, by Major Hannay; Banoo Dzonatu, and Banoo Lakenate (pp. 882-884), from Rungpore, in the district of Moorshedhold, &c., and from Singapore: these the Jury deemed severally worthy of Honourable Mention. Some interesting samples of the fibre of the Urica. heterophylla are contributed by Mr. Thomas (pp. 882this plant is abundant in Mysore, and especially in 884); this plan is acommon in syster, and speciment in the Neilgherries, flourishing in Alpine jurgles: unfor-tunately, it is one of the most highly venomous of all the nertle tribe. It is stated that the Todawars prepare the fibre of this plant by boiling the stems in water, after which, they readily separate it from the woody parts, and then spin it into a coarse but very strong thread. The Malays simply steep the stems in water for ten or twelve days, after which they are so much softened,

that the outer fibrous portion is easily peeled off.

2. "Yercum nar." The fibres of the Caletropis
(Asclepias) giganter, a plantwhich grows wild, abundantly, (Asciptas) graduate, a plantwinen grows wish, abundantly, in various parts of the Rengal and Madrias Presidencies, and is used by the natives in the manufacture of cord, called "Lamb-dore," or "Tonoidee coin." The filtre is of very remarkable strength: from some rocent experiments made by Dr. Wight, its tensicity, as compared with some of the other Indian fibres when made into ropes, is ns follows:---

						Weig	in.
1.	Yercum na	ur	_		Calotropis gigantea -	1be	
	Janapum	-	-	-1	Crotolaria jancea	- 40	
3.	Cutthalay	nar	-		Agave Americana		
	Cotton	-	-	-1	Gossypium herbsceum -		
	Marool	-	-	-	Sanseviera zeylanica -		
6.	Pooley mu	ngu	-	- 1	Hibiscus cannabinus -	20	0
7.	Coir -	-	-	-	Cocco nucifera	22	ŧ

Specimens of the Yercum, or fibre of Asclepias gigantea (and of the Tongoos, and of the Asclepias tentcissima), or bow-string hemp of Rajemahl, are sent from Coimbatore, and other districts in the Madras Presidency.

3. "Umbaree," or "Massice pat;" the fibre of the Palungeo, or Hibisons cannabians, a plant common all over India, and cultivated in many parts for the sake of its fibre. The process, generally adopted, seems to be that of steeping the stems in water till putrefaction be that of steeping the stems in water till patrefaction commences, when they are taken only, washed, and heaten until the fibre separates from the woody portion of the stem: this fibre is contributed from Madras.

4. "Marcol," or "Moorva," how-string hemp, obtained from the Sauseriera zeglariaca, a plant abundant in the southern parts of the continent of India, sent from

Cuttack, Coimbatore, and other distrirts in the Madras Presidency: a good specimen is exhibited by F. Lima

Good samples are contributed from Coimbatore, &c.
7. "Dhunchs," or "Danebe," obtained from obtained from the Eschysomese canasting, used by the natives of Bengal to make fishing-nets; n remarkably strong though rather harsh fibre, pretty well known in commerce. The plant is commonly cultivated in Bengal: good specimens, accompanied by cordage and rope manufactured from it, are exhibited by Messrs. Thompson of Calcutta (p. 884):

these were deemed worthy of Honourable Mention.

8. "Coir," the fibrous part of the busk of the cocon-unt, Cocos secifera, well known in commerce: good samples are sent from Calient

are sent from Calicut.

9. Nat, or also fibre, the produce of the Agaze risipora, and other allied species. A valuable and strong fibre is prepared in usasy parts of ladis, from different fibre is prepared in usasy parts of ladis, from different which are obtained from the large IIII also, and from the small also, illustrating the preparation of the fibre, exhibiting some of the uses to which it is applicable, and thowing the facility with which it may be dyed of various colsent, is contributed by Dr. Hintyras valuable recollements to the Indian collection of fibrous the contribution of the contribu valuable specimens to the Indian collection of fibrous materials. For these the Jury awarded to him a Prize Medal

 Specimens of aloe fibre are contributed from various parts of the Madras Presidency—Madras, Madura, Coim-&c., and from Singapore.

 Yucca fibre, obtained from Yucca gloriosa, is also sent from Madras, by Dr. Hunter (pp. 882-884). 12. Ejoo, or Gommuti, obtained from the Arrega saccharjera (Sagaerus Rusphii), or Gummuttee Palm, much esteemed in the Eastern Archipelago for making ropes and cables, in consequence of its extraordinary ropes and cause, in consequence of its extraordinary clasticity and carability in water; unfortunately, the value of this fibre is greatly diminished by its peculiar fragility. Very good samples of this fibre are contributed by Tan Kim Sixa, in Singapore (pp. 883-884); these were deemed worthy of Homosrable Mention.

13. Patwa, or Mawal fibre, obtained from the Bushiesis.

racewosa, a plant common throughout the lesser hills of India, contributed from Bhangulpore, in the division of

Patos.
Talli Nuns, there of the gine-apple, Brosselia mil- from writem healthire amples are exhibited from Muleus, best of the state of the hilbert from Muleus, best of the state of the hilbert from Muleus, best of the state o tain, for though from its name it might be supposed to be

sine-apple fibre, it more closely resembles that of the or Boebmerins, niready mentioned. remarkably fine that the Jury awarded a Prize Medal to Mr. WERER for it,

Mr. Weines for it. 15. Plantian fibre, and Manilla hemp, obtained from the Mina tertifis and M. paradicatica, routributed from Madras, from Dacca, and by the Rev. M. Sroas, from Chittagong (pp. 882-884). Excellent cauvas and ropes are aboven, made of this fibre, which is extensively used. in the Government establishments at Ceylon. 16. Marsdenia fibre, obtained from the

Roylii, and contributed by his Highness the Maharajam or Nepal. (pp. 882-984). 17. Pulas, fibre of the Buten frondesa, used for making munon cordage, from Beerbhoom, in the division of

Moorshedabad.

18. Parkinsonia fibre, obtained from the stems of Parkinsonia aculeuta, introduced from the West Indies, sent by Mr. Allan, from Madras (pp. 882-884); said to be well suited for the manufacture of paper. 19. Roxburghia fibre, obtained from the Rurburghia

gloriosoides. 20. Artocarpus fibre, obtained from an Artocarpus: this and the preceding fibre are contributed by Mr. Simons, from Assam (pp. 882-884).

21. Trap fibre, obtained from the bark of the trap tree,

21. Trup fibre, obtained from the bark of the trap tree, a species of Arteourpus, contributed from Singapore.
22. Trophis fibre, from the Trophis aspera.
23. Daphne bark, the fibrous bark of the Daphae cansabina, used in the manufacture of Nepal paper.
43. Daphne species these, several other fibrous substances from different parts of India are exhibited, such as the fibres of different parts of India are exhibited, such as the fibres of the Palmyra leaf, Borassas flabelliformia, from Madras, the bark of the Sisse tree, contributed by Captain Rev-No.108 (pp. 882-884), and a series of vegetable fibres from Arracan, called Theng-ban-shaw, Pathayon-shaw, Shaw-phyos, Ngan-tsoung-shaw, Shaw-me, and Es-gywot-shaw, &c., which are Honourably Mentioned.

Several of the Indian fibres, already mentioned, are also contributed from Ceylon. Good samples are shown, both as mere fibres, and also in the various states of thread, rope, and coarse cloths; of coir, aloe flax, and the fibre of the Plantain, Hibiscus, and Sanseveria.

Specimens of also fibre are contributed from the Cape of Good Hope by C. WATKAREYER, of Green Point (17, p. 951).

Aloe fibre, obtained from the Agere Americana and A. vivipara, has been also sent from Barbadoes.

From St. Vincent, samples of the "Mahant" bark in its raw state, the fibrous part in the state in which it is employed in the manufacture of fishing-nets, and samples of lapeto, used also in the manufacture of common cord and coarse lines for fishing nets, are exhibited by G. Bullock, of St. Vincent (p. 975).

Several interesting specimens of various fibres are shown in the collection from British Gniana; amongst snown in the concetton from British Ghiana; amongst, these are specimens of sik-cotton, obtained from the Bombar ceiba, from George Town, Demerara, said to be exported to the United States, and used in the manufac-ture of hats. Exhibited by E. C. Ross (76A and 76B, p. 98t).

p. 981).

Plantain fibre, Mass paradisation and M. sapientum, from Plantaino Vigilance, East Coast, Demerara, exhibited by M. DAYIDSON (Tr., p. 981); and from Plantation Kiein, Ponderoven River, Demerara, exhibited by A. D. VAN DER G. NETREINER (78. p. 982). It is calculated that about 8 ewt. per acre of this excellent fibre middle that the property of the propert might be obtained: at present very little of it is used. It is worthy of remark that, in some of the first lists of premiums offered by the Society of Arts, about 1762, special attention was drawn to the beautiful fibre of the plantain:- "Whereas the stem of the Asiatic and Ame rican fruit-bearing plantain affords three sorts of fibrous materials which resemble hemp, hard silk, and cotton, all which have been experimentally found capable of being wrought into various sorts of manufactures; and, among others, into cordage, fustians, lawn, knitting, gauze, blonde lace, and excellent candle-wicks, sandry specimens of which manufactures may be seen in the hands of the Register of the Society," &c. This advertisement was continued for several successive years, but as an candidate came forward to claim the offered reward, it was at last discoutinued.

Silk-grass fibre, the fibre of the Agave vivipara, from Plantation Vigilance, East Coast, Demerara; and Fibiri fibre, obtained from the Ita paim, Mauritia flerwosa, from the River Berbice, are exhibited by T. B. Duggen (80 and 81, p. 982'

Mohoe or Mahoe-fibre, Hibisens elatus or Thespesia populsea, from Demerara, is exhibited by J. F. Bez (82, p. 982). It is a very strong but coarse fibre, used for

Some good samples of Yucca hemp, together with a leaf of the Yucca serrulata, from which it is obtained, and rope and cordage manufactured from it, are shown by J. T. Thompson, of Nassan, Bahamas (p. 976); also specimens of the fibre of the Palmetto, and of rope made nom it. These were deemed worthy of Honourable

Mention In the Trinidad collection are some specimens of the fibre of the pine-apple and aloe; and also of the fibre of the Mahagua, or Majagua, Sterceles carribra.

Specimens of the leaf and fibre of the Dorganthes excelia are contributed from New South Wales by Sir T. L. Mitchell (p. 990), as well as some rope made of the latter. These were deemed worthy of Honourable Mention.

Some good samples of New Zealand flax, Phornium Some good samples of New Zealandh max, Promission Renar, are contributed by various exhibitors. Amongst others, by Tao Nut, a New Zealand Chief (44, p. 198*); New Zealand flax, as prepared by the natives, by Rev. J. COLLISSON (3, p. 1000); J. ROBERTSON (4, p. 1001); J. CARADUS (24, p. 1002); and by TYRKE (1 and 28, pp. 1000 and 1002); New Zealand flax, cleaned and preared by machinery, exhibited by WHYTLAW & Son (34, . 1002). Each of these exhibitors was deemed worthy

of Honourable Mention. A bale of "New Orleans moss" (Tillandsia usneoides), prepared as a substitute for horse-hair, &c., as a stuffing material for npholstery purposes, is exhibited by G. Hicks (559, p. 1469). This substance possesses considerable (559, p. 1469). This substance possesses considerable elasticity, and appears to be very well adapted for the above-mentioned purpose: it is stated that it may be had in any quantity, and at a comparatively small price. The Jury awarded a Prize Medal for this fibre, which though not altogether new in the Londo flore, which, does not be a comparative or the control of the control not appear so well known as it deserves to be.

A sample of the fibrous husks of the maize, or Indian A supper of the network masts or the make, or thanks over, also used for stuffing mattresses, is shown by F. O. KETTRRIDGE, of Mount Verron, New Hampsbire (235, p. 1452). This substance, though not so good as the "New Orleans moss," being much more brittle and less clastic, was deemed worthy of Honourable Mention. In the Austrian collections, specimens of fibrous wood divided into very thin and slender strips, and used instead

curvacu into very thin and stender strips, and used instead of straw in the manufacture of a sort of phatied work, are shown by S. Tarsitan, of Zinowald, near Toplitz, in Bohemia (657, p. 1031). A Prise Medal was awarded for this ingenious application.
A specimen of Cysourus cristatus is shown by A specimen of Cynosurus cristatus is shown by L. Vanden Abele, of Appels, West Flanders (p. 1153).

I nis also was deemed deserving of Honourable Meution.
Samples of China-grass, or nettle-fibre, Uritica (Bookmeria sieses, From China, are exhibited by C. M. COPLAND
(pp. 1421, 1422), and by Mrs. Rawsox (p. 1434).
A good fibre, prepared from the date palm (132), together with rope, strug, nets, and brushes made from the
fibres, are contributed from Republe China. bres, are contributed from Broulos, Ghizeh, and other

Places in Egypt.

A useful fibrous material, proposed as a substitute for animal hair, and slso for other purposes, obtained from the dwarf palm of Algeria, is exhibited by AVERSEG & Co., of Toulouse, in the Algerian collection (3, p. 1259). The Jury awarded a Prize Medal for the introduction of this substance.

A new fibrous material, proposed for wadding, for clothing, and for upholstery work, in stuffing mattresses, &c., is exhibited by C. G. Faniax, of Humboldsew, seer Breslan (95, p. 1054). This substance, which is called "pine wool," is prepared from the leaves or needles of

pine trees: it is soft and somewhat elastic, though the fibre is very weak, so that it would perhaps soon mat or felt together in mattresses. It has been found to be very cleanly, and peculiarly free from the attacks of insects and might probably be advantageously employed, mixed with some stronger and more elastic fibre. The Jury awarded a Prize Medal for this substance.

A good sample of aloe fibre, prepared from the Agare deericana, is exhibited by the Manquis DE Ficaliso Portugal, 535, p. 1313). This was deemed worthy of

Honourable Mention Specimens of flax, cotton, pits, or aloe fibre, and mallow fibre, are contributed from Madeira.

A fine and very beautiful fibrous material, called "Bejuco," is exhibited from the island of Lazon by the Economical Society of Mantala (234, p. 1344). This substance is very strong, and is used in the manufacture of plaited work, and a sort of clotb remarkable for its strength and softness. The Jury awarded a Prize Medal for it.

Specimens of several of the textile fibres of Cuba are contributed by RAMON DR LA SAGRA (pp. 1338, 1339), including the Daguilla or fibrous inner bark of the Lagetta lintearia, together with cord made of it; cord and mats made of pain fibres; Magagna, the fibre of the Parities clatum, and the fibre of the Hibiscus cannabius. were deemed worthy of Hononrable Mention. Samples of a valuable grass, the Macrockloa tenaciasims

Samples of a valuable grass, the Marrocated tenerations, much used for the manufacture of cord, &c., and which might probably be advantageously employed by papermakers, are exhibited by D. YILLARS, of Husca (158, p. 1539). This was deemed worthy of Honourable p. 1339). Mention.

Plantain fibre, prepared from the stem of the plantain, Mass superstam, is exhibited by A. Vinas, of Pnerto Rico (160, p. 1339); and Pita, the fibre of the wild aloe, foure Americana, is shown by P. DE LAS HERAS, of Murcia (161, p. 1339).

SECTION VI.- CELLULAR SUBSTANCES.

Comparatively few substances demanding the attention of the Jury are exhibited in this division: they may, in fact, be included under three heads,—namely, cork, rice

fact, hi included under three boats.— namely, cost, rice upper, and namedo or Gurman tudor.

Gurman tudor. Gurman tudor.

small: the most important series is a small collection where by T. Fact (13, p. 2007) in literation of his most important series is a small collection where the control of the control

the polac of the Archipelago, used for making floats for fishing-nets, are shown in the East Indian collection. Good samples of French cork, both in the rough state

and when cut by De Bossimon's patent machinery, are exhibited by Durnar & Co." (492, p. 1201). Some fine specimens of Algerine cork are likewise shown in the French Department in the collection exhibited by the COMMISSION of WOODS and FORESTS (47, Alger., p. 1262).
These were deemed worthy of Honourable Mention.
One specimen of good Portnguese cork is contributed

Very good samples of cork are shown in the Spanish collection by J. GUINART,* of Seville (188, p. 1341), and by the Province of GERONA.* These were each deemed worthy of Honourable Mentinn

worthy of Hosonanie Stemm.
Samples of "shois," the cellular pith-like stems of the Aichjassusses aspera (Helysarus logearium) from the vicinity of Calcutta, are shown in the East Indian collection. This remerkable substance, which closely resembles in appearance the well-known "rice paper," well

^{*} Awarded a Prize Medal by Jury of t'less XXVIII.

merits attention, and promises to be available for several purposes in the arts. The specimens of shola are accompaosed by various illustrations of the uses to which it is applied in India, including life-buoys, boxes, bottle-cases, and hats. From its loosely-cellular structure it is a very had conductor of heat, and this, together with its great lightness, admirably fits it for the manufacture of hats. Shola is also used advantageously for purposes of ornament, and very beautiful models of temples and other eastern buildings are exhibited, which possess all the appearance of ivory, hat with even more softness and delicacy of surface. These specimens were deemed worthy of Honourable Mention.

Rice paper, made from the pith of Aralio papyrifero, from China, is likewise shown, Two good series of specimens of prepared amadou, or German tinder, the leathery base of a fungus (Boletus igniorius), are eshibited, namely, in the Austrian colsystems of estimates, namely, in the Australia col-lection, by Bacharch (45a, p. 1009), and in the Zollverein Department by F. A. Becker Sapp & Co., of Fredeburg (471, p. 1078). These were each deemed worthy of Honorrable Montion

SECTION VII.-TIMBER AND ORNAMENTAL WOODS. The collection of timber and other woods, taken as a whole, is remarkably complete and interesting; and though in many instances it is abviously impossible for the Jury to enter into the consideration of individual woods, or to do more than enumerate the varieties of the specimens shown, and even difficult in all cases to do int,-yet they considered it desirable to prepare as comthat,—yet they consiste of the various single collections plete a list as possible of the various single collections plete a list as possible of the various single operations are consistent of the various countries. The Jury would expecially draw statistion to the very interesting and valuable collections of East Indian woods (p. 885); the complete and well-arranged collection of W. W. SAINDERS (Class IV., p. 190°); the series of fine specimens shown by Messer, Fartwilson; series of fine specimens shown by Mesira, Faintierov; the very instructive and excellent specimens eshibled by Mesira, Lawson (135, pp. 205*, 200*), and by the Frincia Mixipte or Wan (p. 1625) in the Algerian collection of raw produce. Highly valuable, also, are the series of Canadian, Australian, and other colonial woods; and the namerous collection of the woods of Cuba, &c. &c. The total annual importation of timber into Great

million of cubic feet, entered under the several designations of timber or unsawn wood, deals and planks or sawn wood, tesk, staves, and lathwood.

The following Table shows the countries from which wood was chiefly imported in the year 1849:-

			Timber.	Deals.	Tesk.	Staves.	Lothwood

A very beautiful series of about 160 samples of the most useful and ornamental woods from various parts of the world is shown by Messrs. R. and J. HARRISON (6, pp. 195", 196"). The woods are all cut in the form of books, and admirably exhibit the grain and other pecu-liarities of each specimen. For this collection also, the Jury awarded a Prize Medal

A collection of ornamental foreign woods, and other materials employed in cabinet-work, is shown by Messrs. R. Faustleboy and Sons (135, pp. 205*, 206*). The number of woods about fifty, the specimens being all cut and polished, so as to show the grain and colour of the wood to the greatest advantage. Of most of the woods, two or three specimeus are shown side by side, one in the rough, or with the bark oo, one in section, and a third cut loogitudinally and polished. For this series the Jury awarded a Prize Medal.

A valuable and instructive series of all the priorinal woods used for turning is shown by Messrs, HOLTZAPFFEL (14, p. 196*), the character of each wood illustrated by the end of the specimen being turned, so as to show how it works under the tool in the latbe. For this collection the Jury awarded a Prize Medal.

Some remarkably fine specimens of veneering, in wal-out and rosewood, are exhibited by Messrs. E. Scott and To these the Jury awarded a Prize Medal. A valuable and extensive collection of 63 of the timbers and ornamental woods of England is contributed by

S. Cross (136, pp. 206*, 207*, 205*). This was deemed worthy of Honourable Mention.

The series of Scotch woods shown in Messrs, Lawson's collection (Class III., p. 206) is interesting on account of the beauty of the specimens, the excellent manoer io of the seasify or the spectimens, the execution manner to which they are arranged and shown, and the instructive mode in which the characters and peculiar properties of each tree are mude evident. The sections of grafts and diseases of trees are peculiarly good. Praise is also due to this, as to all the other divisions of Nesars, Lawson's collection, for the excellent catalogue which accompanies tre

The collection of foreign woods included in the Liverpool series of imports is also highly deserving of ootice: many of the specimeus are unusually fine, and they are all well shown and arranged. (See p. 69.)

Healdes these more important collections, various sin-

gle specimens deserving Honourable Mention are exhigle specimens deserving Honourable Meotion are exhibited. Among these are some samples of woods grows in Perthshire and Angyleshire by the Marquis of Brazaza-naxe (134, p. 205*); a sample of Sentch fir grown in Strathavoo, from Sir W. Mcnaz, Bart. (137, p. 208*); a series of frish woods exhibited by J. Lova (47, p. 198*); a small collection of Irish woods contribated by J. Ctas son (22, p. 196*). These were severally deemed worthy of Honourable Mention.

Beautiful specimens are exhibited of St. Domiogo mahogany, from Messrs, Grillow and Co. (15, p. 196*); and some remarkably handsome oak veneers from an oak grown in Whittlehury Forest, Northamptonshire, are also exhibited by Messrs. Gillow (Class XXVI. 186, p. 748), These were severally deemed worthy of Hopourable Mention.

A pieture-frame exhibited by D. Samuels (21A, p.196*), formed of various common English woods, chiefly cak, elm, and ash, was deemed worthy of Honourable Meu-

Some good specimens of Euglish woods are likewise exhibited by F. C. Fercu (8, p. 196*).

tainited by F. C. Ferch (8, p. 196*). Several specimens of hog wood of different kieds, nod

from various localities, are shown. Among these are tions various localities, are shown. Among these are slabs of bog oak, yew, and fir, from Lord Dillon (138, p. 208*); and bog fir from the Marquis of BREADALBANK (134, p. 205*). These were severally deemed worthy of

Honourable Mentioo In coonexion with the various collections of wood, In coonexion with the various collectious or wood, attention must be paid to the different processes for scassing and preserving it from the influence of the weather, dry rot, sod the attacks of insects, boriogworms, &c. These and other causes form very serious obstacles to the use of wood for many purposes; and obstacles to the use of wood for many purposes; and accordingly a oumber of plans have from time to time been proposed, having for their object the cheap and effectual preservation of wood. Among these schemes, five in particular have attracted especial attention; namely, the plans of Messrs. KYAN, BOUCHERIE, BUR-NETT, BETHELL, and PAYNE. Of these, the first and last are not represented in the Enhilition, and therefore do not come before the Jury, though the machinery em-ployed by Mr. Payne is exhibited, but without my specimeo of impregnated or preserved wood.

Sir W. Bunnerr exhibits an interesting series of speci-

mens in illustration of his mode of preserving wood, &c., and in proof of its efficacy (7, p. 186°). This pracess, which consists in impregnating it with a solution of chloride of sine, was parented in 1836, four years after the date of Kyan's patent, in which a solution of corrosive sublimate was employed for the same purpose. The specimens shown are highly satisfactory, and clearly prove the high preserving power of the solution of sine.
The Jury awarded a Prize Medal for this process.
The specimens shown by Mr. J. RETHELL (21, p. 196*)

are likewise highly interesting and satisfactory. The process employed in this case, and for which a patent was obtained in 1838, consists in thoroughly impreg-nating the wood with oil of tar continuing creosote, and a crade solution of acetate of iron, commonly called py-roliguite of iron. The idea of preserving wood by the action of oil of tar, or similar liquids, is by no means new. In 1756, Hales recommended that the planks of ships should be soaked in vegetable oil to prevent the injury to which wood is subject when alternately exposed to wet and dry; and, indeed, many ships were built in which a hollow place was cut in one end of each beam or stern-post, so that it might be constantly kept filled with train oil. Among other ships so constructed, the "Fame," 74, may be mentioned. When, after some years, this ship was repaired, it was found that, as far as the oil had penetrated—samely, from 12 to 18 inches from the end—the wood was quite sound, whilst the other parts were more or less decayed. In 1805, Mr. Maconochie proposed to saturate with resinous and oily matters inferior woods, and thus render them some last This proposal was practically carried out in 1811 by Mr. Lukin, who constructed a peculiar oven for the purpose of thus impregnating wood under the influence of an increased temperature. The scheme, however, had but very partial success, for either the heat was too low and the wood was not thoroughly aired and seasoned, or it was too high and the wood was more or less scorehed and burut. The importance of oil as a pre-serving agent for wood is also shown by the fact that whalers, and other ships employed in the oil trade, the timbers of which become thoroughly saturated with oil or grease, invariably last longer-and are less subject to decay of any sort-than other vessels. It is also well known that the staves of old tallow-casks make a more lasting and durable fence than any other sort of woodan effect entirely due to the protecting influence of the

The operation, as conducted by Mr. Bethell, is carried on in a strong cylindrical vessel connected with a powerful air-pump, so that in the first instance a vacuum being formed, and subsequently a pressure of several ntmospheres applied, the liquid may as much as possible be forced into all the pores of the wood. It is stated that wood thus prepared is not only protected from de-cay, and from the attacks of insects, but also that it becomes stronger and tougher in consequence of the layer of bituminous untter with which the woody fibre becomes encrusted. Among the specimens exhibited are portions of railway sleepers which have been in use for several years, and which are perfectly sound, whilst others from the same situation, but oot prepared, are quite destroyed. Portions of piles which have been four years in the sea in Lowestoft harbonr, and which are quite sound, are also shown. This process has been extensively employed in the preparation of railway sleepers for more than ten years, and the result of its application appears in every case to be highly satisfactory where the process has been well and properly conducted. The Jury therefore awarded a Prize Medal for it to Mr. Bethell. (See p. 153.) The mere seasoning of wood, though it will not nl-

together prevent its decaying, nevertheless considerably diminishes its tendency to do so, and is of the very named importance in many cases. The value of any process for seasoning wood depends, of course, to some extent, on the

time required for its completion. A valuable series of specimens is shown by Mr. C. H. NEWTON (20, p. 196*) in illustration of Davison and Symington's potent process for speedily and effectually seasoning wood by exponing it to the influence of a rapid and continuous current of heated air, so that it soon becomes thoroughly dry. The practical value of this process appears to be satisfactorily proved, and the Jury accordingly deemed it worthy of Honourable Mention

A fine specimen of elm, cut across the grain, and well

A nice specimen or emi, cut across the grain, and well-seasoned by steeping in whiter and very slow dryling, is shown by Sir W. Micanav. Bart. (137, p. 2008). A sample of Welch ook, stated to be sessoned by a new process, which renders it better suited to the pur-poses of the cabinet-maker, is exhibited by W. Evaxas (9a, p. 196*). The collection of East Indian woods, exhibited by the

HONOCHARLE EAST INDIA COMPANY (p. 884) is by far the most extensive series of woods in the whole Exhibition, and constitutes a very valuable part of the great collection of Indian raw produce. It is remarkable for the large number of specimens, the excellence of many of them, and the valuable practical information to be gained by their examination. The collection consists of many hundred specimens, and includes several minor or local collections of great interest. Amongst these are the valuable collections of Drs. Roxacass and Wallet (884, 885); and extensive series of the woods of the Malay peninsula, Asuherst, Tavoy, Tenasserim, Prince of Wales Island, Assum, Cuddapah, Madras, Orissa, &c.

Considering the extent and importance of Dr. Wallich's collection, the Jury would certainly have awarded to him a medal had not the fact of his being a member of the Jury precluded them from doing so. They awarded a Prize Medal to Mr. Commissioner Beundell (p. 885), for a very valuable collection of Amherst woods. They also awarded a Prize Medal to Messrs. ALMEIDA of Singapore (p. 890), for fine specimens of Lingua-wood and Kayu-huka. 19. COM, for une specimens of Lingon-wood and Kayu-huka. The smaller series of woods contributed by Mestrs. A. P. ONSLOW, of Ganjam; D. Mayne, of Caddapah (p. 188); Walter Ellitor of Vingapatian; J. E. Chapman; Lieut. Col. Tellocu; The Commissant-General of Mannas; Captaio OGILVIE, of Musuliputam; Captain MAITLANN, and Major BALFOUR, of Madras; Dr. HENTER, of Madras; Dr. Winht, of Combatore; Captain Mar-QUART, of Chittagong; and J. R. Colvin, of Moulmein (pp. 888, 891), were also severally deemed worthy of Ho-nourable Mection.

The nature and properties of many of these Indian woods is very little known; and though, for the most part, it is not probable that it would be found worth while to import them into Europe, yet their importance to India is every year increasing, and must necessarily continue to do so, as the demand for timber in India for railways and other engineering works increases. For such uses it is desirable, not only that the wood should be strong and not liable to decay from mere exposure to the weather, hat, also, that it should work freely, and be able to withstand the ravages of the various insects to which wood of all kinds is more or less exposed in tropical countries. It is true that even the most porous and spongy woods may be rendered to some extent capable of resisting all such influences, by being impregnated with various solutions, as in the processes just adverted to; but it is obviously for better, when possible, to select such woods as are naturally saturated with resinous and aromatic substances, as in this latter case all cost of preparation is saved, besides that the preserving matter is far more perfectly disse-minated throughout the whole of the wood than can possibly be effected by any artificial process after the tree is felled

In examining the comparative value of different sorts of wood, it is of the first importance to ascertain the nature of the encrusting nutter deposited throughout the cells and tabes of the wood. For all practical purposes, those woods appear to be best in which the cells are lined with resinous matter; those filled with hygroscopic gammy matter are, for the most part, of less value; they are seasoned with difficulty, and are always more liable to cuted by our artizans.

deny. The best woods are those having a strong fiber propertied from all external influences by a cost of respin one which does not attent importance instructure.

When the contract interpretation is the cost of the cost

The wood of several species of *Briedelia* forms building purposes, seems little—if at all—inferior to excellent timber. The Avanna, *Briedelia mostoov*, is teck; it is said to resist the action of water quite as common in Canara, where it attains great airo, and, for well.

```

"Chatiyan" or "Sativeen," Alstonia scholaris, grows to a large size in the forests of Canorn, the wood is white and compact, and well adapted for turning pur-

The "Jorrol" or "Jarul," Lagerstremia Regime.
This tree grows to a great size in the Chittagong district, though the forests are now, to o great extent, eleared of the best variety. It is considered an excellent wood for ship-building; it is tough, has the character of standing well in woter, and is much used for beams, reflers, and boards.

reflere, and because of "Gambhari," Gmelion achero, in shundart in the Morung and Chitogong forces. It is a weak wood, but is in great estimation for pieture-frames, sounding-boards, organ-pipes, Venetian blinds, and all sorts of light work in which shrinkage is to be avoided. Its specific gravity in 0/466; its strength, according to Caphin Black, compared to tech, ox 459 ig 8-66.

Captain Baker, compared to teak, os 499 to 869.

"Toon," Cedecla Toons, is a somewhat coarse-grained wood, but very extensively need throughout India for furniture and interior carpenters' work.

These specimens are from Dr. Carey's Botanie Garden near Caleutta. The blackwood or "rosewood" "sit-sid. Dalberjus indipidoja grows to a very large size on the Malabor coast. It is a close-grained, greecish, block wood, braudifully marked with lighter-coloured veins. It is a heavy, elose-grained wood, and is much need in the manufacture of furniture, as it takes a very high polish,

For engineering purposes, and especially for gun carriages, it is very valuable, and in consequence large formers of it have been formed in waste places in the North West provinces of Hindustan.

"Saudal word" (Seatelain alliam) is well known and cyteeraed, on account of its peeuliar perfume. It is used in calinate-work, for faos, basks, ornaments, and all sortes carred faney-work. The bark of this tree contains a beautiful red colouring matter, which, however, does not oppear to be practically made use of.

and extensively used of all the timber trees of India. It is a heavy, close-grained, light-hrown wood. From the bad and careless manner in which the trees are felled, and from the jujudicious mode in which the timber is squared, its value is often considerably diminished. The Saul timber brought down to Calcutta is seldom more than 30 feet in length. Its specific gravity varies from 0.92 to 1.182, and in strength and tenscity it is considerably superior to the best teak. From Captain Baker's excellent experiments, it appears that, compared with teak, its strength is about as 1121 to 869. From Major II. Campbell's valuable experiments, unseasoned Saul broke with a weight of 130s lbs., seasoned Saul with 1319 lbs., and teak wood with 1091 lbs. It is nuquestionably the most useful known Indian timber for

tionably the most useful known Indian timber for engineering purposes; as a building wood, unless very well seasoned, it is somewhat apt to shrink. "Kadum berriya," Dispyros ebwaester, a variety of Coronandel or Calamander, a striped wood, having a light-hrown colour; it is a handsome furniture wood, which turns well, and is admirably adapted for veneering, and nil sorts of cubinet-work,

"Huragulu," Chloroxylon swietenia, yields the beau-tiful wood used for veneering and other cahinet-work, commonly called Satin-wood; the tree never grows to n

Chiata kurra," Tamarindus indica, is a strong and handsome wood, used for furniture, for washermen's handsome wood, used to remain the property boards, and in the manufacture of oil and sugar mills.

No. 16 .- WOODS OF MALABAR FORESTS (J. E. CHAPMAN).

10, Ombah. 1. Jamboo; a very heavy | 11. Pood goossa.
12. Ruccult korurab; a very straight-grained wood. wood 2 Kad kud. 3. Kelaho. 4. Koompoi 5. Kendel; a heavy, strong, close wood. 14. Sarrah. 15. Secrass. 16. Sood beebo. dark wood.

6. Kunganec. 7. Kursion. 17. Sawree; a white, soft wood, very light. 8. Kumdee. 9. Marlen; a very heavy, wood, wood, 18. Teb pully. 8. Kumdee.

"Jamboo," or Jamba, Misson relocarpa. This tree grows to a large size: on account of its strength and toughness, it is much valued for house-building.

"Mairtee," Pentapiera coriacea, a very common tree
both above and below the Ghants. The wood is very durable, and is therefore used in house, ship, and hout-

huilding. These woods were collected, in 1846, by Dr. Gibsou, Conservator of Forests in the Bombay Presidency, for Mr. Chapman, in connexion with the projected "Great Indian Peninsula Railway." Previous to the appoint-ment of Dr. Gibson, the forests in this presidency, particularly those south of Bombay and between the western Ghauts and the Indian Ocean, were almost entirely left to the management of the natives in their immediate neighbourhood; the consequence of this was, that, as the country under British rule became more settled, and as the population in those districts increased, the forests ware gradually destroyed, the timber being out down in the most reckiess and wasteful manner, and a consider-able quantity of it burnt, for the mere purpose of affording ashes for manore. Regulations have now, however, been adopted, under the superintendence of Dr. Gibson, for the preservation and maiotenance of forests, so that, for the future, such thoughtless and inconsiderate defor the interest of them will be prevented. At present, the Government and mercantile yards of Bombay are chiefly

supplied with timber from the Concan, to the north of the latitude of Bombay. In the Decean, the supply of timber, of any size, is very limited; it has, therefore, for the most part, to be brought from a distance, and the expense and difficulties of transit present serious obstacles to its employment in buildings of all descriptions. Mr. Chapman states, that a short time since, when Viceajee Merjee, Esq., an enterprising Parsee capitalist, built a house at Hyderalud, he was obliged to have all the principal beams carried up from Bombay, a distance of more than 500 miles; and at the present time, most of the timber of the country is greatly diminished in value, being of occessity ent down, and reduced to shapes and sizes most convenient for land-carriage. From Dr. Gibson's reports it appears that the forests of Soosda and Casara, if properly managed, will, in a few years, afford a large and regular supply of first-rate timber.

No. 17,-WOODS OF ROBILKUND, These are from the districts of Barelly and Phillibhect-Mulberry. 1. Aencia Arablea. 13. Melia Azadirnehta; entechu 3. Bassin Intifolia neem or nlmb. 14. Aescia serissa. Bombax heptaphyllum. 15. Nauclea parvifolia, 5. Calyptraothera sp. 16. cordifolia. 17. Phyllauthus Emblica. 6. Cedrela sp. 7. Chowince (?) 18. Rohance (f) 8. Dalbergia sisson. 19. Shores robusts 9, Goshum (1) 10, Grewia. 20, Urseina (?) 21, Wrightia mollistima.

The "Sisson wood," Dalbergia Sisson, somewhat resembles the finer sorts of teak, but it is tougher, and more elastic. It usually grows to a height of about 30 feet, but is generally more or less crooked, and therefore not suited for beams, though highly valued by the ship-hailders of Bengal. The wood is said to harden with age. When fresh, its specific gravity is 0 691; when seasoned, 0.764; and according to Captain Baker, compared with teak, its strength is as 1030 to 869. It has a light grey ish-

Some fine planks of teak, from Raugoon, nearly 31 feet wide, are exhibited by Mr. McDowell (p. 888); these were deemed deserving of Honourable Mention. Teak is n light-brown, porous, and quick-growing wood; it derives much of its value from the aromatic, oily substance with which it is more or less saturated in the fresh state. A very interesting series of examples of teak wood, formed by Mr. Serrixos, of Calcutta, is contributed from the Naval Department of the Honourable East India Compasy. It consists of 72 specimens from various localities, and the weight of each, per cubic foot, has been care-fully ascertained. From the experiments of Major II. Campbell, it appears that the density of teak wood varies from 0.534 to 0.876, according to its quality and the mode in which it is seasoned; whilst Captain Baker found it to wary from 0.631 to 0.792. It is evident, however, from the following table, which shows the results of Mr. Sepping's experiments, that the specific gravity of teak varies considerably more, not only between the wood of different forests, but even in different parts of the same beam.

No. 31.-WOODS OF THE INDIAN ARCHIPELAGO.

Extensive collections of woods from Borneo, New Guinea, and several other of the Archipelago islands, are contributed; including sandal-wood from Timor, and Liugea, or Amboyna wood, from Ceram, in the Moluccas, This wood, which is very durable, and takes a high polish, was imported from the Moluccas in considerable quantities at the time when the latter were British possessions; It is very abundant, and may be had in any quantity. Very large circular slabs are obtained from the lower part of the tree by taking advantage of the spurs, or Interal growths; they are sometimes as large as nine feet (Chinese, in diameter. A circular disk of wood thus obtained, Labasa;—

> nearly seven feet in diameter, as well as some other spe cimens, are exhibited by Messrs. ALMKIDA (p. 891), of cimens, are exhibited by messis. Alamada the control singapore, and were decimed deserving of a Prize Medal by the Jury. Specimens are also shown of the "Kaya-Iloka," which is brought from Ceram, New Guinea, Arra, and the other islands of the Moluceas, to Singapore; it is a knotty excrescence, which forms on the stems of the Lingon tree, and is much esteemed as a fancy wood for cahinet-work; of late years its estimation seems to have decreased in Europe, but it is still much valued by the Chinese. The following is a list of the woods from

A large tree; used only for planks; soon decays. A tail thin tree; used for planks.

only used for planks.

A band, fice, close-grained, heavy wood, 30. Kurctia (21) A very lard, fine, close-grained, heavy wood Probably specifically identical with Sapsomilile, with which it coincides in every respect.

31. Meenumillie (60) 32. Millele (5) -[1'ede No. 43.]

33. Moolmein Tesk (64). A very hard, fine, close-grained, an I very ponderous wood. Nas (72) A rather hard, very face, close-grained, heavy wood. 3). Namede (34)

Hard, though coarse, open-grained, heavy wood. Hard, rather fine, generally close-grained, presenting, bowever, many open cells; heavy. 36 Aandoon (48) 37. Obbairia (55) -38. Palmira (71) -A species of palm. A bard, fine, close-grained, heavy wood: heart-wood deep red-brown, recent layers red-33. Palno (65) -

dish yellow; its compact, even structure, indicates that it is admirably adapted for turnery work. A soft, coarse, open-grained, light wood. 40, Patta Dell (62) -

A very hard, fine, close-grainest, ugus wood. A very hard, fine, close-grainest, heavy wood. A soft, firm, but rather open, though even-grained, light wood. 41, Pelnu (54) - - - 42, Sapon (53) - - 43, Saponillie (77)

A soft, rather coarse, open-grained, light wood.

A hard, fine, close-grained, leavy wood.

A hard, fine, close-grained, leavy wood, and open-grained, beavy wood, of a deep chessul colour. 44. Sattin (61) -45, Sporive (73) A narra, mongh smewhit, fine, close-grained, very heavy wood.

A hard, fine, close-grained, rather heavy wood, much resembling English birch.

A rather hand, fine, close, even-grained, beavy wood. 46. Tamarind (4) = 47. Tarine (35) = 48. Wanedfle (37) =

WOODS OF CAPE OF GOOD HOPE, &c. Several interesting specimens of timber and other woods are contributed from South Africa and the Cape of Good Hope. One specimen in particular deserves special notice; it is called Red Ebony, from Natal, and is contributed by C. J. Bress (60, p. 952). It is a hard, heavy, very close-grained, red wood, admirably adapted for turning and the finer sorts of eabinet work; npproximating in fact, in character, somewhat to ivory. This wood appears to be new, and it is unquestionably a valuable addition to the hard ornamental woods already known; the Jury, accordingly, awarded a Prize Medal for it.

A valuable small collection of the woods of the Cupe of Good Hope, is exhibited from the Monayian Mussion at Gnathendal (44, p. 950); it consists of thirty speeimens, and was deemed worthy of Honourable Mention. The minexed table contains a list of these woods, their sizes, and the uses to which they are applied in the evolony.—(See Table I., p. 141.)

A second reries of Cape woods, including a number not in the Gnathendal Collection, and valuable because the specimens are shown in the bark, is exhibited by H.

DOWNLETON OF George District (47, p. 951.; this was likewise deensed worthy of Honourable Mention. (For list of this series, see Table II., pp. 141, 142.) A specimen of leak wood, from the Western Coast of Africa, a valuable timber, well known and valued by ship-huilders, is shown by Warwick Weston (1, p. 952).

WOODS OF CANADA

Very remarkable specimens of the chief varieties of Canadian timber are exhibited; especially the collection shown by the Central Commission of Montreal (80, p. 963), for which the Jury awarded n Prize Medal (see p. 7). It includes excellent specimens of the following woods:-1 Ash engled. 4. Bass wood. 5. Cedar, penell. 6. Eim. 7. Elm, red rock. 8. Iron wood. 9. Maple, soft. 2. Birch, white, 3. Butter-put.

283, 984, 2801; and 10 J. N. STUCHRITH (SSA, 116, 111, ac., pp. 982, and 985), for their collections of woods; and they deemed the specimens shown by A. BUTHANAN (86, 91, 93, 96, pp. 982, 983); T. B. D'GOINY (90g, 93, 100, 101, 102, p. 984); T. RACERY (93, 4p. 983); G. PONTIFEX, (102n, p. 984); T. BER (103, 105, 116, 117, &c., p. 118, p. 118 985), severally deserving of Honourable Mention. Mr. Bee also exhibits a numerous series of small sam

10. Maple, hard, 13. Oak, white.
11. ,, bird'seye. 15. ,, yellow 18. Tamarack. 19. Walnut, black. 15. ,, yellow, 16. ,, white. 12. Oak, red.

The butter-nut, and black walnut are excellent furni-Inre woods, and hardly seem to be so well known or appreciated as they deserve. Very fine specimens of butter-unt, birch, pine, cherry, eurled black walnut, and maple, both curled and bird's-eye, are exhibited by Messrs, REED and MEAKINS of Montreal (75, p. 963) these were also judged worthy of a Prize Medal by the Jury.

Fine specimens are also shown of curled black walnut

Fine specimens are also shown of curred ones wainin by — Fissiry, of Simceo (78, p. 963); of bird'seyer maple, by J. Ecan, of Ottawa (74, p. 963); of black wainin, by J. Hassoo, of Dawn (79, p. 963); and of soft imple and chestinit, by J. and F. Parinartin, of St. Martin (76 and 77, p. 963). The Jury deemed each of these deserving of Honourable Mentica. Small samples of a few woods from New Brunswick are

exhibited; namely, bird's-eye and curly maple, black birch, and the candleberry myrtle. A few woods are contributed from Nova Scotia; including curled and bird's-eye maple, hirch, and white and grey oak.

WOODS OF BRITISH GUIANA. A valuable and very interesting collection of timber

and other woods from British Guiann, is contributed by several independent exhibitors. The Jury nwarded Prize Medals to J. OUTRIDGE (84, 84A, 85, 85B, 85c, 87, 88, 89, 91, 92, 97, 98, 104 to 115, 1170, E, r, a, n, &c., pp. 982, 983, 984, 985); and to J, S, Stuennuny (85a, 116, 117n, ples of the chief woods of Guiana (156, p. 987).-See List, pp. 143-146.

WOODS OF BRITISH GULANA.

 Biack greenheart. 85c.] 	[858,	Duramen deep hrown: recent layers narrow, pale-ochre vellow.
		The timber of this tree is used for ship-building, planks, &c., and is considered mare durable than the common green-heart. The specimens sent are from a tree supposed
- 70 11 -1 500 11		to be about 50 years old.

 Blackheart. [111, 111a.] - 8 This is a good wood for house frames, and for making furniture. It will square from 6 to 7 inches, from 20 to 30 feet-loog.

(Meanings Shows a diameter of 12 inches, Ia bark. A fine close-graland, moderately hard, and 3. Bully-tree, sp.?) [91, 91a.]

Shown a diameter of 12 isebes. Is bark. A fine close-gralacd, moderately hard, and rather heavy wood; from the likere Demersar. The tree yielding this wood is supposed to be a species of Missaspa. It is found through out the coloury, but most absumantly in the country of Berkliee. It is of green size, and squares From 20 to 20 isebes, and may be obtained from 20 to 30 feet long. The weather has little effect upon it, and It is employed for boase-frames, posts, floors, &c. The upper portion of the trunk and branches are manufactured into thingles, wheel-

4. Cahacalli, [112, 112a.] - Shows a diameter of 4j loches. In bark. A fin rather leavy wood; from the River Demerara. In bark. A fine close-grained, moderately hard, and This wood is impregnated with a hitter principle, which defends it against worms; it lasts well under sater, and is much used for planking colooy eraft. It must, however, be fastemed with exopper nails. It will square from 12 to 16 inches, or even more,

from 40 to 45 feet long. 5. Camara, or tonkin-bean Shows a diameter of 29 inches. In bark. A fine close-grained, hard, and very heavy word: from the River Essecuibo.

(Dipteryx odoro Willd), [95, 95a.] This wood is obtained from Dipteruz oderate, Willd, : the tree which produces the well-This wood is obtained from *Dispays chemia*, Willel: to there which produces the well-house makes here. It is acts, togeth, and charled in a meliant depres, and it is also flowers as the less than the contract of the contr

6. Coffee tree (Coffee biea). [116, 116a.]

hows a diameter of 5 inches. In bark. An exceedingly light and soft, though fine even-grained wood; from the River Berbice. 7. Cork-wood (Pterocarpus Shows a diameter of 5 inches. Draco, Linn.; P. suberoses, Pors.) [102, 102a.] 8. Cork-wood. [102b.]-A curious excrescence, styled in tho label "an abatment of the foregoing." In form, very like rough cock; about an inch in thickness throughout, caveloped in a thin hard

bark. The wood is much softer than in 102 and 102a, and would doubtless afford as excellent substitute for cork, for entomological purposes. From Troolis Island in the River Essequibo. As abutment from near the root of the tree. This wood is supposed to be obtained from Pterscorpus Drace, Linn., or P. subcrosss, Pers., and is chiefly used as floats for fish-

ing-nets Shows a diameter of 5½ laches. In bark. An open-grained, moderately soft, and rather light wood; from Plantation Woodhanis, Siver Mahaica. This wood is obtained from Ariesania aidea, Jacq., a tree of surprising rapidity of growth. These specimens are from a tree five years old. The wood is perishable when 9. Courida (Aricennia ni-tida, Jac.) [103, 103e.]

exposed to the atmosphere, but is very durable under ground, and is, therefore, used In foundations for haildings. 10. Coutaballi. [110, 110a.] - Shows a diameter of 5 inches. In bark. A very fine, close-grained, hard, heavy wood;

from the River Demerars.

The tree which yields this timber grows upon sand-bills; the wood is very hard and durable, if not exposed in the weather; it is pleutiful, and principally used for losser-frames, and will squared In lacks, from 30 to 40 feet long.

Shows a diameter of 7] huches, in hark. A tolerably hard, even-grained rather light wood. In great reputs, and largely used in the colony for interior work; from the wood. In great reputs, and largely used in the colony for interior work; from the from the River Demerara.

11. Crab-wood (Xylocarpus carapa, Spreng.; Co-raps Guinessis, Auhl.) River Deme

Note Description, Ann.)

[106, 1004.]

This word in behind from Xydecryse crops, byteres, or Groupe Giusevain, And., bytering crops, byteres, or Groupe Giusevain, And., but the second from t hows a diameter of 6 inches. In bark. A rather hard, but not very close or orea-grained wood. The most valuable of the British Guiana woods for ship-building pur-

grammen woos, ane most valoutho of the British Giusan wooms for ship-building pur-poses, where it is used chiefly for the bottoms of vessies; grows to a much larger size than represented in the present specimen; from the Biver Democram. This wood is used for musts, become, and planking for colonial craft; and as insecte do not infect it, it is well adapted for cheesty, wardrobes, &c. It will square from 14 to

13. Greenheart (Nectumera: Benth.) [85, Its inches, from 40 to 60 feet in length
Shows a diameter of 12 inches. In bark. A very hard, heavy, fine, but not even-grained
wood. Duramen deep hrown, recent layers broad pale yellow; from the River De-86a.] merara,

merans.
The Greenheart tree is very ajundant, and its timbers, squaring from 18 to 24 inches, can he procured from 60 to 70 feet long. It is a fine-grained hard wood, well adapted for the planking of venesis, isome-frames, whareve, hridges, and other purposes where great strength and durability are required. Mr. Manifold, engineer of the Demersen Railway, states, that this is the best timber for resisting tensile and compressive strains, and is therefore weil adapted for kolsous for skips, and bount.

14. Hackia, or Lignum vitee Diameter 15 inches; from the River Demerara. This wood, known in the colony as Ignum rule, is said to be obtained from Guriorem officinols, Litn.; but this seems doubtful, as the tree producing the wood attains a height of from 30 to 60 feet, and squares 16 to 18 inches, whilst the Guriorum officinols. (Guaiseum officinale, Linn.?) [98, 98a.] is described as a comparatively small tree, about 4 or 5 laches in diameter. It is used

WOODS OF BRITISH GUIANA-continued.

		for mill-eogs, and shafts.	The specime	us sent are from a tree supposed to be abo	at 40

blows a summerer of 15 inches. In orr. A nine cross-grained, hairly heavy wood. Durameu deep-red chestuat; albarman nut brown; from the River Demerarias.
This wood is very close and fine-grained, is easily worked, takes a high polish, and le much used in the colony for furniture. It may be had from 15 to 20 inches square, 40 to 76 feet long. The specimens sent are from a tree supposed to be alsout 20 years old.

16, Hyawaballi, [1174, 1174.] Shows a diameter of S inches. In bark. A fine, close-grained, hard, heavy wood; from the River Demerara

This tree is scarce. This wood, known as zebra wood, is used for furniture. The spe-elineus sout or from a tree supposed to be about 25 years old. Shows a dismeter of 5 inches. In bank. A highl, though rather fine close-grained white 17. Hyawa (frica keptaphylla, Shows a diameter of 5 inches, Aubl.) [101, 101a.] wood; from the River Bert wood: from the River Berbice.

This wood is abtained from the Icica heptaphylla, Aubl., or lacense Irea, yielding the gum hyawa. 18. Itaballi (Tochgoia Gui-anennie, Aubl.) [117f; Shows a diameter of 11 inches. In bark. An open grained, light, and rather soft wood; from the River Demerara.

The tree which produces this wood is Porhysia Guignensis, Aubl., and is used by the Indians for making corials, 19. Itikiribouraballi. (Mar Shows a diameter of 12 luches. In bark. A close-grained, hard, heavy wood; duramen bright chestnut; alburaum broad, white; from River Demerara.

This wood is supposed to be obtained from Macheriem Schomberghii, Benth. The trunk charium Schowburghi Henth.?) [104, 104a.]

grows to the length of from 30 to 40 feet, and squares from 12 to 16 inches. It is used chiefly for eablact-work. chiefly for cannet-work.

Shows a diameter of D inches. In bark. A fine, close, even-grained wood, hard and heavy. Duramen deep red brown; alburnum broad, pale, dirty yellow; from the River Kakar Ally. [87, 87a.]

This wood is very plentiful, and it has been proved that it is more durable than greenanse room is very poentium, nou it mas teen proven tout it is more durable than green-hear! it is all water, as it possesses the quality of resisting the depredations of the sea-worm and barneele. It may be had from 6 to 14 inches square. The specimens sent are supposed to be about 20 years old. Shows a diameter of 6 inches. Centre inversed by a longitudinal cylindrical furrow,

are apposed to be about a year of the property Laua (Graipa Americana, Line.) [19, 93a.] moderately hard, rather heavy. Bark !

This wood is obtained from Genipa Americano, Linn.: the fruit of which yields the Indian plement known as Lana dyo. The tree is very high, and the trunk will frequently square from 14 to 16 inches. The wood is close-grained, and is not liable to split. 21ª Kosuerettaballi. Shows a diameter of 44 inches. In bark. A very close-grained, hard, heavy wood; from [102, 10Ja.] the River Demerars

This wood forms excellent rafters, and beams for cottages. It grows from 20 to 30 feet Illia wood forms exercisent maters, and occurs not consequent in grow-long, and is from 4 to 6 inches in diameter. Celled by the Indians, "Bourra Courra." 20 inches × 4 × 13. Fine, close-grained, hard, ond rather heavy; a beautiful wood, of a bright-red chestnat colour, with small rhom-22. Letter-wood (Brosimum
- Aubletii, Poep, Pira-tinera Guianensis Aubl.)

and rather heavy; a bountful wood, of a bright-rest electron colour, with small from-comment in the property of the property of the property of the colour colour, and the colour colour, are exhibited, red k.o. 184; unfortunately, it nevertinas heavy sizes. From the colour, are exhibited, red k.o. 184; unfortunately, it nevertinas heavy sizes. This is abstract from Emission Assisting, Crops, or Porturas Grissmond, Asid, and is with black spots, which have been compared to thereplyphics; the apprint part being with black spots, which have been compared to thereplyphics; the apprint part being received to the hour, which is selden more than 10 to 10 loads in detrametrone. If

is adapted for cabinet-work of small size, and for venecring only. From its extreme hardness it is difficult to work, and is therefore little used.

23. Marisibalii. [117r, 117s.] Shows a dismerer of 8 inches. In bark. An exceedingly close-grained, hard, heavy wood: from the liver Demorara.

This tree is picntiful, and is used chiefly for spars. It will square from 13 to 14 inches, from 30 to 40 feet in length. The specimens seot are from a tree supposed to be about 20 years old Shows a dismeter of 7 inebes. A wood very like that of the English pear tree. In bark; 24. Mammee

apple-tree AMERICANO from the River Berbice. (Mammer America Linn.) [100, 100er] This wood is obtained from the Manney Americana, Linn., which produces a Mammee apple, or wild apricot of South America. Shows a diameter of 12 inches. in bark. A hard, heavy, close, but not even-grained exectea,

25. Mora (Mora exe Benth.) [84, 84a.] wood; from the River Demerara. producing this wood frequently reaches a height of upwards of 100 feet. It he tree producing this wood frequently reaches a height of upwards of 100 feet. It grows abundantly on barren sandar-reft. It is tought, elois, and error-grained, and is peculiarly adapted for ships timbers and planks, for whird purpose It is extensively used. The trust of this tree, when of the include form 40 to 50 rest, will square from 18 to 20 inches, but when grown to that its, it is generally faulty. The specimens sert are from a tree supposed to be from 30 to 49 years old.

Purpleheart (Copajfrea publiflora or bractesto). [86, 86a.]

sent are from a tree supposed to be from 30 to 40 years old.

Shown a dismeter of 14 inches. In bear?. A hard and ponderous, though open-grained wood. Dermanen, in longitudiname of the policy of the sent of the shafis, rollers, and machine

what's, rollers, and metalizer's. In latt. 	WOODS OF BAHAMA.
A fine series of the w- specimens contributed by	oods of Bahama is included in the collection of raw produce from that colony. The Messrs. Baines (p. 976) were deemed worthy of Honourable Mention,
1. Cedar = =	in used principally in house-building, for door and window framer, plozze-posts, silt, girslers, &c. It grows on several of the Balanan islands, but it found in greater alumnlance on Aniro Island; and its size, when foll-grown, is from 16 to 20 feet in length, and forts in douser's it is generally earl to 16 feet in length, and from a cost of its of the control of the cost of a first several cost of the local full distance. This is one of the most it was several the risk has one of the most resentant the risk has, and emitting the fragmant order of the consume pretril celar.
2, Cedar	 This wood is used principally for picture-frames and other ornamented articles of rubinet- work; there is no difference between it and No. I, except its curied and shaded appearance, which is said to be obtained by its growth in a very rocky roid.
3, Horseflesh mahogany	- Is principally need in house-building, the branches and crooked trees for aligh 'finders, it is a very durable wood, and grows on several of the Balana islands, but is found of large-size, and in greater quantities at Andros Island, where it grows to about 20 feet in learner; It is, however, seldon brought out of the woods of that size, from the want of proper means of conveyance. A hard, fine-grained wood, heavy, and cabilithm numerous own relis.
4. Dogwood	 The principal uses made of this wood are for felloes of wheels and ships' timbers; from its toughness and interproperties, it is better adapted to the former purpose than any other of the Bahamian woods. The tree does not attain any considerable size, and is generally erooked. A rather soft, open-grained, light, but evidently very tough wood.
5. Stapper wood	 I'sol principally for piles to wharfs, and for wheel-spokes; it is a very strong and durable word; if grows from 12 to 16 feet long, and from 6 to 8 feebes in diameter; it is found on all the Balamian islands. An exceedingly land, fine, close-grained, very heavy wood.
6. Lignum	This wood grows on several of the Bahama Islands, and is generally exported to Europe and America, where it is used for sheaves to blocks, ke. The principal use made of it in the Bahamas to for hinges and fastenings for houses vibunced by the sea-shore, or in the vicinity of sail-ponds on the oct-blands, where, from the quick corrosion of from, hinges, &c. of that metal are seldom used.

7. Bahassa Satin wood
This wood, commonly called yellow wood, grows shundantly on Andros Island, and others of the Bahassian groop: it grows to a large size. A sard, fine, close-grained wood, showing on its polished surface a beautifolly ripped pattern.

WOODS OF BAHAMA-continued,

Specimen of a deeper colour, showing a pretty mortied pattern.

This wood, commonly called "Madeira," grows abundantly on Andres Island, and others of the Bahamas group, is not exceeded in durability by any of the Bahamas woods: It grows of a large size, but is generally out of small dimensions, owing to the 8. Bebanus Satin wood - -9. Bahama mehogany want of proper roads, and other means of conveyance; it is principally used for bedwant of proper rouds, soon once means of conveyance; it is principally used for occurs steads, &e., and the crocked trees and branches for ships timbers. A hard, fine, and rather close-grained, moderately heavy wood, of a fine rich colour, equal to that of beanish mehogany, although probably too hard to be well adapted for the purposes to which this latter is usually applied.

10. Crab wood = Mostly used for picture-frames, walking-sticks, and small ornamented cabinet-work : it seldom grows larger than from 3 to 4 inches in diameter. A rather hard, fine, close-grained, moderately heavy wood; heart-wood of a beautiful velned Vandyke-brown, its external edge bright black, alburuum of a pure white,

A small collection of the woods of South America is ramwood, ebony, mahogany, sanden, green Heart, box, exhibited by — Dz.xcox. The specimens are very small, festie, rosewood, Brazillette, and various palms, &e. and amount to 39 in numbers; they include the callabah,

WOODS OF TRINIDAD.

Some very beautiful specimens of ornamental and other woods are shown in the excellent collection of the raw produce of Trinidad, contributed by His Excellency Lord Harris, the Governor (see p. 71). They are as follows:-1. Achras balata, L. (balata A timber extensively used and much esteemed; diameter from 2 to 6 feet.

or valate) Achres (zapotilla or zapodilla). 2 Achras, sp. (acoma or A timber held in high estimation, as indeed are all the woods derived from the present mastic).

family of trees. It varies in diameter from 2 to 4 feet, sclerocarpa Yields beautiful veneers. A palm. 4. Acrocomia (gru gru). 5. Astrocuryum aculeatum Also appertaining to the order "Palme," and affording excellent veneers for ornamental

(gri gri).

Broimum guianense (letter which yields this beautiful wood never attains a large size; its recent layers are of on uniform valuations. ter-rood).

7. Buclda Buceras (olivia) - A coarse-grained strong wood, principally employed for making shingles; its diamater ranges from 2 to 4 feet.

8. Campa guinnensis (cn- Bears a considerable resemblance to cedar, and is extensively used and much esteemed; rapa).

diameter from 2 to 3 feet.

9. Cedrela odorata (West InA very useful and oroamental timber, from 3 to 12 feet in diameter.

10. Cocos ouelfers (cocos- The cocos-nut palm.

11. Considers officinalis (en- A heautiful and durable wood

12. Cordia, sp. (sepc) — A light wood, recenbiling English elm, impregnated with a bitter principle, which preserve it from the attack of insects; it is much valued, diameter from 1 to 2 feet.

13. Crescentia Cujete (sale)

14. Crey strong tough wood; used in boat-ballsling, and for variens other purposes, where boatly.

14. Daibergia, sp. (roble).

15. Geoffroya inermis (l'an- A strong hard wood, extensively used for naves of wheels, &c. gelioe).

 Grey mangrove.
 Gniacum officinale (gula- Bois lizard. can).

18. Rematoxylon campechiannm (log-wood). 19. Hymenes courbaril West Jadia locust; an abundant and valuable timber; diameter 2 to 6 feet.

(courbaril) 20. Lecythis Idatimon (aguatagnro).

21. Mimosa juliflora (yoka A very hard and useful wood. savan). 22. Morus tinetoria (fustic, or bois d'orange).

23. Paltivia. 24. Purple-heart - An shundant and useful timber, 2 to 4 feet in diameter. Rhopala montana (agua-tapana)
 A very durable and curious wood, succeptible of a fine pollsh, 18 inches to 3 feet in diameter.

tapana) 26. Sideroxylon (sp. ?) (ironwood, or bois gri). 27. Swistenia mahogani (ma-

hogany). A very strong and tough wood, esteemed for fellors of wheels, 28. Twompons."

— A very strong ond tength wood, esteemed for teness of warran.

28. Twompons poul (green poul) Theet trees, belonging to the natural order "Bipmonalees," farnish the hardest an 30. Teeoma seravifolis (grey most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish, and has a peculiar colour most darable of woods; their (limber takes a fine polish). they furnish the favourite timbers of the colony, are very abundant, 3 to 4 feet

poul). 31, Tecoma sp. (black poul). 32, Yoka - . diameter, and proportionably lofty.

A bandsome wood, resembling malogany, usually 2 to 3 feet diameter.

A very fine large specimen of "exteries word," or West
Indian celar (Carter observed, from Trivibida, is exist in white by T. Y. C. Bennery; this was decemed worthy of

WOODS OF WESTERN AUSTRALIA.

In the interesting and valuable collection of the Colonization Assurance Company, already alluded to (rec p. 8), are some fine specimens of the woods of the country, including some remarkable pieces of Eucalyptus wood. It is however stated, that owing to the period of the year when they were collected, the short time which could be devoted to their preparation, and the want of proper saws, &c., the specimens sent are not to be considered as fairly representing the woods of this part of the country. The woods sent are-

1. Banksia, sp. - - - Abundant throughout the colony; a very ornamental wood; the specimen sent is from Guildford. 2. Cypress -3. Jam-wood -

Galletori. Abundant on Garden Island, Rottnest, and also in some places on the mainland. A species of Acacia, commonly called "napherry-jam wood," to consequence of its peculiar odour, reversabling rapphersize. It grows abundantly throughout the settled peculiar odour, resembling rasphermes. It grows assumantely incomposes the section districts; it is well a lapted for turning, and as it takes a very high polish, is suitable

for all outs of calastee-wisel, the for limitedly aboyed for ablp-haliding, and indeed for Thirt excellent words, considered to be a finished place of the calasteel in any quantity; it say be het is planks, a first wide. The short can be obtained in any quantity; it say be het in planks, a first wide. The short can be obtained in any quantity; it say be het in planks, a first wide. The short can be obtained in some parts, about 60 mine from the excellence; grows to a green beight, and extuding in some parts, about 60 mine from the sus-diment; grows to a green beight, and extudent and immerter of more than 3 feet. For the manufacture of spikes and other states of simulation of more than 3 feet. For the manufacture of spikes and other simulations. 4. Jorrak (Encatyptus, sp.)

5. Morrell (Eucalyptus, sp.)

wrights' work it is excellent. 6. Red ebony (?) - - id to be very abundant at Sharks' Bay, and along the sea-coast; this wood is very different from the red about exhibited from Port Naml.

7. Red gum (Eucalyptus The tree is very abundant throughout the colony, and the wood is admirably adapted for wheelwrights' work. resinifera) 8. Salmon bark (Eucalyptus

A good durable wood, much used for farming implements. It is tolerably abundant in York district, and grows to a considerable size. sp.). York district, and grows to a consummor size.

Abundant in the settled districts beyond the Darling range, at a distance of about 50 miles from the sea-coast. It has lately been discovered, of a very superior quality, on 9. Sandal-mond =

the coast at Sharks' Bay. 10. Satin-wood -Occurs in the island of Rottnest. 11. Shr-oak (Casuarina) = 12. Tourt (Eucalyptus, sp.)-Very sbundant.

Very summant.

A noble timber; tolerably abundant on the coast, and said to be well adapted for ship-building and general purposes. The plank exhibited is more than 3 feet wide, and is contributed by W. P. Ciliton, of Bunbury. Planks, some 10 feet wide, may be 13. York gum (Eucalyptus,

onsigned.

Keresenees formed on the stem of this and also of some other Encatypti, similar to the

"Kaya boku" of the Lingon wood, and like it, well adapted for faury cablact-work,

It is stated that the exhibitors had hoped to have procured and seur a pisuk of the

Blue gum (Encatyptus globalus) from the Deep river, it deet in width, but were onable sp.) to do so, for want of saws of sufficient size,

A very remarkable and interesting collection of the woods WHITESIDES, of Hobart Town,-Black-wood, myrtleof Van Diemen's Land, is formed by the contributions of His Excellency Sir W. T. Denison, Messes, Fowlers, Whitesides, McNaughten, Harden, Baowneige, and wood, and musk-wood (91-93, p. 994). A remarkably large section of iron-wood is exhibited by Eustron and Millian (105, p. 994); specimens of the Tokon tree, honeymekle, and she-oak, by H. Hull.

To each of these the Jury severally awarded a Prize Medal The specimeos showo are as follows :-(208, p. 996); of oak, myrtle, cherry, and honeysuckle, Baownatga,-Musk-wood (107, 108, p. 994). (208, p. 996); of onl., myrtle, cherry, and honeyauckle, by the Rev. E. Fareman, of Brown's River (210, p. 996); of blue gum and maple by — Qu'in, of Hobart Town 194, 95, p. 994); and in Norfolk Island pine, by Licot. Arran, R.E. (322, p. 998). Each of these was decined worthy of Honourable Mention.

BBOVWRIGG.—Musk-wood (107, 108, p. 994).
Sir W. T. Divrsov.—Hose gram, stringy bark, hack wood, assafras, myrthc, mask-wood, ecdar, eclery-pine, wood, assafras, myrthc, mask-wood, ender, eclery-pine, iron-wood, and maple (1, p. 992).
Fawats, of Maria Ishad.—Dog-wood, mask-wood, he-cak, and Tasminian iron-wood (108, 199, p. 94).
Capt. W. C. Hadders.—Musk-wood (104, 104, p. 94).
R. V. HOOD.—Sirve water, mask-wood, links-wood, links-wood These various woods are arranged in the following table. One of the most remarkable of the specimena shown is the blue gum exhibited by Sir W. DESISON; it consists of two pieces, one a section of the tree just

Huon pine, and myrtle (111-120, p. 994).

McNauonten, of Hobart Town,—Musk-wood (209. above the surface of the ground, and about 6 feet in dia-meter; the second a section of the same tree, 134 feet p. 996).

J. Milligan.-Richea-wood, piok-wood, and Oysterfrom the preceding one, and which measures about 24 foot across bay pine (341, 342, p. 999).

WOODS OF VAN DIEMEN'S LAND.

Black-wood (Acada me - A very hock, clemograined, thek, and rightly-related wood; it is well adapted for cabinet-wood in the state of all series, and may be had it no symmetry, and either this flac wood is minimably shown in some of the articles of fundamental which is dark bon is well occurred with the equility bounding light wood of the Bloom which is dark bon is well occurred with the equility bounding light wood of the Bloom which is dark bon is well occurred with the equility bounding light wood of the Bloom which is dark bon is well occurred with the equility bounding light wood of the Bloom which is the state of the state

WOODS OF VAN DIEMEN'S LAND-continued.

2. Illue gum (Escalyptus globulus).

An enormous tree; it is said to be equal to ook for sbip-building, and may be obtained in beams of any dimension up to 200 feet in length. It appears somewhat premature to speak very decidedly of the value of this romparatively new wood, but, or tical results already obtained, it certainly promises to be a most important material for the ship-builder. A blue gum tree near Tobosa, on the northern aspect of Mount Wellington range, measured upwards of 30 feet in diameter at the base; and this is by no means unusually large for the trees of this species. According to the Ray. Mr. Ewing, a swamp gun-tree has been measured 102 feet in circumference, at 3 feet from

the ground. 3. Colar, or Pencil pine (Arthrotaxis sciagi-It grows in the monutain ravines and gorges, and in the high table-land about 4000 feet above the level of the sea. noides?).

neides?).

A clery pine (Phyllocladus A handsome tree, which grows in the cold and moist parts of Yan Brenes's Land, and supersididus).

Statina's height of 150 feet. The word is close-grained, and besuitfully white; it is, Cherry (Excosupus on A small ground first with lively green follage; withly sattered on the enters is die of predictional).

Degwood (Beddeclas, pp. 7) This tree nations to considerable after Marits build; the word is very righly and maintain to considerable after Marits highed; the word is very righly and

besutifully marked, it is consequently an excellent cabinet wood, and well adapted for

beautifully marked, it is consequently an exercise cannot wood, any two sequences assurants.

7. Honeyruckia (Banka) and for of ornamental wood is handsome, and useful for cablest work not for rener-assurants).

8. Honey Them (Derrytion) I for facts is employed in taming.

8. Honey Them (Derrytion) A most remarkably beautiful light-changed wood, singularly marked with dark spots, per a first property of the term is indirable for ornamental furniture.

9. Ha-oak (Casuarina A low tree, of no great beauty or value, which grows upon the open grounds stricta)

10. Iron-wood (Notilia ligustrins).

A tree which rarely attains a greater diameter than 12 to 14 inches; the specimen
exhibited, however, is nearly 2 feet. The wood is very hard and dense, and has been
consequently made late shaves for ships blocks.

11. Iron-wood of Norfolk Said to be the most durable of all the Norfolk Island woods. island (Olea apetala).

12. Maple of Norfolk Island.

13. Musk-wood (Eury bia ar-

A comparatively small tree, which grows only in dense forests and close, damp situations. The wood is close-grained, very beautifully marked, especially at the lower part of the-butt, and takes a fine polish. It is most admirably adapted for venecring and other gophylla).

but, and takes a me pount. 11 or non-management of the page County Charles and takes a me pount. 12 me pount of the page County Charles are described for the page County Charles and the page County Charles are page County Charles and the page County Charles are page County Charles and the page County Charles are page County Charles and the page County Security Charles and the page County Charles are page County Security Security Charles and the page County Security Security Security Charles and the page County Security Security Security Charles and the page County Security tiful polish.

15. Pine, Ovster-hay (Calli- Gross only on the eastern coast. The wood is used for internal fittings in bouses, and

tris australis). inc. Norfolk for agricultural implements. 16. Pine, Norfolk zero. (Arnucaria excelsa). Island Very transparent in thin pieces; a good wood for turning.

17 Pinkwood (Carpodouts

Grown chiefly on the western side of the Island, in the dense myrtle forests. It attains a
height of 100 to 150 feet, with a clear straight stem. The wood is fine-grained, and
very hard; it has been used for the shewes of slop blocks.

Richea - wood (Richea Grows only in the deep moint forests on the western side of the Island; attains a height pandanifolia).
 Rose-wood or Zebra-wood Said to be plentiful in Lake country, and shoul Martborough.

(Acacia, sp.) (Athero- A moderate-sized tree; very abundant. The wood is soft, even, and close-grained; wall-hatum).

alagted for internal building, flooring-boards, cabin-fittings, &c.; it turns well.

Beef-wood A hard and beautifully-marked cabinet-wood; it takes a high polish. 20. Sassafras-wood sperma moschatum). 21. She-Oak, or Beef-wood

18. She'clak, or Berteroux A memberson.
(Chromicine squirityinhilida).
28. Stringy-bark (Encolypton A commons tree; very alundast. A stringy-bark tree, near the Cum river, on the robotts).

18. The trans alone 272 time of inher. The world a muber convers thin that of the common tree; the salest problems.

18. The trans alone 272 time of inher. The world a muber convers thin that of the converse than the conver

24. White-wood (Pittosporum beloim equires a greater diameter than a foot. The wood has a remarkably close even bicolor).

25. White Oak of Norfolk and might therefore, perhaps, be employed by wood-engravers. It is used by the natives for their "waddles," or war-club.

Island (Hibiscus Pa-tersonii).

A valuable little collection of the woods of New Zealand are cathibited by J. Junksox (21, p. 1001), and by W. Pox, these the Juny awarded a Prize Medal.

These were theremed worthy of thousarable Mention.

WOODS OF AMERICA.

The collection of American woods is by nn means numerous. It consists of two separate series, and a few isolated specimens; the series contributed by R. J. Pell, of New York (115, p. 1446), consists of 167 specimens; unfortunately, however, many of these are cut from small branches or young trees, and do not therefore well show the characters of the wood; it was, nevertheless, deemed worthy of Hanourable Mention.

1. Acer striatum - -- Moose wood. 8. Betula populifolia White birch Bird's-eye maple, Hemlock spruce. White maple, 9. Cupressus juniperus - -10. Castanea vesca - - -11. Cerasus virginiana - -Cypress cedar.
American chestant. Wild cherry. Common hickory. - Sugar maple. 12. Carva tementosa - - -6. Berwood, 7. Blue degwood. 13. Diospyros - -Persimon

23. Ulmas salvia — — Red or slippery elm.

A few good specimens of the chief woods of Maryland are also exhibited by the MANYLAND COMMITTEE
(371, p. 1459), consisting of ash, beech, cedar, cherry,
hickory, holly, locust, maple, mulberry, cak, pine, poplar,
and walnut; these were deemed worthy of Honourable

Mention. (See p. 71.)
Specimens of Palmetto cedar, live oak, and a few other
woods, are exhibited by E. B. Brat, of Charleston, South
Carolina (176, p. 1448*); these also were deemed worthy

Garolina (176, p. 1448³); these also were deemed worthy of Honourable Mention. It is hardly necessary to advert to the importance of the wood of the live only. Quereus vivus, its value as a ship timber being universally known and recognized.

A sample of sweet gam-wood is contributed by J. It.

or Naverna, of Charleston (1984, p. 148). Ph. Austria.

Collection are a cries of pine planks, Ables factifies, as prepared for the use of manifold-internment nakers, propared for the use of manifold-internment nakers, as the propared for the use of manifold-internment nakers, in the production of the propared for the propare

have been nearly five centuries old. These specimens

were deemed worthy of Honourable Mention.

WOODS OF CHINA.

A numerous collection of the woods of China is exhibited by the Ber. Dr. Parkkin (12, p. 1422). It is much to be regretted that these specimens are so and in a scarcely to show the characters of the woods; many of the specimens have no labels, and of those which have, a considerable number are evidently incorrectly named; the following is a list of the labels:—

	1	
1. Canton resewood		
2. Chan muh		
3. Chang muh -	Camphor-wood.	
4. Chan muh		
5. Chung tu		An inferior kind of pine.
6. Elsony.		
7. Hwang jung muh	Yellow Dryandra.	
8. " muh		
9. Ilwa Nien	Averrhos Carambols.	
10. Isz King muh -	Thorn-wood.	
II. Kan muh		Wood of the Coolie orange.
12. Knu muh.		
13. Kuin tien kuh -		A fine wood for cabinet-work.
14. Kih now mnh.		
15. Kung mph	Tailow tree (?)	
16. Kwang lang -		Used for rhills of sedans.
17. Lew muh		
18. Lung ven muh -	Dimocarpus inngven.	
19. Lan muh	Canarium Pimela	Wood of the Chinese plive.

WOODS OF ALGERIA

A highly-valuable collection of the woods of Algeria is shown to the Algerian Department of the French Col-ctions. These specimens are remarkable for their beauty, and for the skilfal and instructive manner in which lections. ted.

they are exhibited. Some of them Some of the woods are comparatively	are rather small, but io all cases they are characteristic and well selected, sew to this country. They are as follows:—
1. Thuys-articulé; an evergreen tree	Thuja articulata, Desf.? 6 × 5 × 2. Close grain, hard, heart-wood (duramen) bright chestnut-coloured, resinous; recent layers (albumum) cream-yellow. This wood is supnosed by some to be the "sandal-wood" of the ascients.
 Pin ploier; an evergreen tree - Grand cypres d'Italie; an evergreen tree. 	Pinus Piuen, $6 \times 2\frac{1}{2} \times 1\frac{1}{2}$. Specimen from a young tree, in bark; a resinous wood. Cupressus, sp. (?) 6×3 ; $\times 2\frac{1}{2}$; in bark; a resinous wood.
4. Ricin; a dociduous type	Paliurus. (?) 6 × 4 × 2½; an exceedingly soft, light, weak wood; in bark. (Palma Christi, or Christ's thoru).
5. Jujuhler sative	Ziziphus, ap. 6 × 5 × 2. An exceedingly close, fine-grained wood, heavy; heart bright-red chestnut, recent layers, pale ochreous; in bark.
6. Aune; a declduous tree	Alaus, 6 x 9 x 2; a light, though fine, and close-grained, soft weak wood, of an uniform reddish-yellow throughout; in bark,
7. Pln maritime; an evergreen tree -	Pirus maritima, (?) 6 × 8 × 2, in bark; a resinous wood.
8. Sanle fragile; a deciduous tree -	Sally fracilis, (1) 6 × 11 × 11, in bark : a soft and weak wood.
9. Génévrier Phénicien	Juniperus Phornices, (?) 8 × 5 × 2. This specimen was cut from a portion of a
	tree having a diameter of about 9 inches only; in bark; from Zeraida.
10. Grand eyprès	Cupressus, sp., 94 × 4 × 2, from a tree 1 metra in diameter; from the environs of Riedah
11. Summe Therèza	Rbus, sp., 9\frac{1}{2} \times 4 \times 2. Wood heavy; its longitudinal section exhibits numerous open cells: in bark.
 Jnjubier des lotophages; a decidu- ous tree. 	
13. Phillyres : a decidnous tree	Phillyres, sp., 6 × 54 × 2; a close-grained, hard, and heavy wood.
14. Lentisque commun	Pistacja, sp., 8×5×21; a hard, heavy wood.
15. Chène-zeen	8 × 54 × 2; a tree, a metre in dismeter, from Edough.
16. Grand bruyère arborescente, over-	- 61 × 2 × 2. Wood fine, close-grained, hard. (Tree-like heath.)
green trec.	-,,
17. Cedre ; an evergreen tree	Cupressus, sp., 6 × 6 × 2; in bark; resinous wood.
18. Figuier sauvage,-bols tendre à	Figure Carica, 6 × 6 × 2: a soft and weak wood,
fenilles caduques ; a deciduous tree.	
 Platachier-térébinthe; a deciduous tree. 	$Pistacia\ lereb in thus, 8\times 6 \}\times 2. Wood close-grained, hard, heavy, and resinous.$
20. Cytise	Cytlens, sp., 9 × 23 × 14. Wood fine and close-grained, hard, heavy; heart chestmut; recent layers narrowly white.
21. Temeris; evergreen tree	Tamariz, 6 × 6 1 × 2 1, in bark; a resinous wood.
22. Saule-marceau; a deciduous tree -	Salix., sp., 6 × 6 × 2; a fine-grained, soft, and weak wood; light wood, in bark.
23. Térébinthe, ou le faux pistachier -	a large tree, 1.3 metre in diameter.
24. Carcubier	Cercle sillquastrum, 8 × 7 × 1, in bark; a tree, 9 ln. in diameter, from Monzaia.
25. Olivier souvage	Olea, sp , 6 × 6 × 2, in bark : a tree, 10 Inches in diameter, from Monzaia,
26. Sorbier cormier; a decidnous tree.	Sorbus terminals, 6 × 64 × 24; shows a diameter of about 11 inches; in bark; a hard wood.
27. Arbousier; an evergreen tree -	Arbutus, sp., 6 × 7 × 2; shows a diameter of about 12 inches; in bark; a hard- wood.
an Astronomy	Arbutus on 12 VSI VI : bark on both longitudinal odges; a tree 10 longer in

- A numerous series of small specimens of the woods of the Upper Pyrenees, suitable for cahinel-work, is also exhibited (St. Unexy, 1495, p. 1248). They are valuable chiefly as showing the grain and character of the different woods, when polished and varnished, and as employed

Celtia.

- by cabinet-makers. The Jury awarded a Prize Medal for this collection. Specimens of acueia wood, as employed for muchine are exhibited by Moussillac-Amand, of La Réole (933, 1224); these were deemed worthy of Honourable
- p. 1224; Mention. Some very interesting specimens of preserved wood are shown by I. A. Botchernens in preserved wood are shown by I. A. Botchernens (1104, p. 1230), in illustration of his process of protecting timber from decay, dry-rot, and the attacks of insects.
- The remarkable experiments of Dr. Boucherie, on the absorption of saline and other solutions by trees, are well known, and excited very general interest about ten years since. He has, for a long time, been engaged in an extended and minute series of experiments on wood, the object of which was to ascertain the substance best fitted to preserve timber from decay, and to discover the most economical mode of practically applying it on the large scale. The peculiar feature of Dr. Boncherie's original process consisted in the mode in which he availed himself of the vital power of the tree; for, fullowing up the suggestions of flales, Duhamel, and others, he arrived at the conclusion that it is far easier to impregnate wood with any desired solution when the plant is still full of its own natural juices, and when fresbly cut down, than it is when the vessels have begun to contract, and a considerable portion of the natural humidity of the wood has evaporated. In the first instance, indeed, he endeavoured to impregnate the wood of the tree whilst still in a growing state, causing it to suck up various solutions, by means of the absorbing power of the leaves themselves; a process which, bowever, for various practical reasons, he subsequently abundoned; and, at the present time he adopts a chenp, simple, and effective process for impreg-nating the felled timber with the preserving liquid, preserving liquid, designated in France, "trait de scie, et la cuisse fonlante The trank of the newly-felled tree is cut into a length snitable for two railway sleepers; it is then very nearly divided across, just in the centre, by means of a saw, so as to form a channel, or small reservoir, in the very centre of the log, hy means of which the preserving liquid may pars, right and left, towards either end; the opening of the saw-cut is then carefully closed all round, and a small flexible tube being introduced into the upper part, serves to convey into the cut the preserving liquid, which, as it is laid on through the flexible tubes, under the pressureof a column of some feet in height, is rapidly disseminated throughout the entire substance of the wood. The pre-serving liquid which Dr. Boncherie emplays, and which

- Juniperus, 6 × 31 × 2; shows a diameter of about 4 inches. Alburnum pura white, duramen dark chestaut; in bark; a resinous wood,
- Hex, sp., 6 × 3 × 2, in bark; slows a diameter of about 4 inches; a hard wood. Laurus, sp., 6 × 5 × 2; a light, soft, weak, open-grained wood; in bark. ———6 × 2 × 1 ½; moderately hard, though light, weak, and open-grained; in bark. Crategus, sp., 6 × 6 × 2; a fine, close-grained, hard, and rather heavy wood; in
- Rhammas Alaternus, 6×5×2. A hard, and heavy, though open-grained wood; alburnum fine citron-yellow; duramen dark red-brown; in back; shows a diameter of about 6 inches
- Citrus Limunium, 6 × 21 × 15; shows a diameter of about 35 inches; in bark; Citrus Aurantium, 6 × 5 × 2; shows a diameter of about 10 inches; in bark; a
 - hard wood. diameter of about 11 inches; in bark. a light, soft, weak, and open-grained wood; shows a
- Quereus, sp. Quercus llex.
 - a solution of sulphate of copper. When he desires to increase the hardness of the wood, he uses a solution of pyrolignite of iron; and when his object is to render it flexible, elastic, and at the same time incombustible, he employs a solution of chloride of calcium. By the abovementioned process, Dr. Boucherie has prepared many thousands of railway sleepers with sulphate of copper, and some which have been down on the Great Northern Railway of France, for five years, are at the present time perfectly sound; whilst similar ones, not prepared, which
 - have been on the same line, are completely destroyed. The Jury, appreciating the very long and laborious series of experiments made by Dr. Boncheric, and satisfied with the successful issue to which he has now tished with the succession pane to what he process, brought them, awarded him a Prize Medal far the process, considered of wood for sounding-beards of musical instruments are exhibited by J. HENSTER, of Lindberg, near Liusel, in Bavaria (76, p. 1101); these were deemed worthy of Honographe Mention.
 - A enlication of woods, extremely well-selected and arranged, is exhibited by Professor Nondanassa, of Ilnhenheim, Stuttgard (4, 11, pp. 114, 115). These specimens are exceedingly well prepared, so as to show all the chief characters of each wood; though small, each sample is left in the bark, and good microscupic sections accompany each wood. As a small collection, it is accompany each wood. As a small collection, it is admirable, and the Jury accordingly awarded a Prize
 - A comparatively small number only of Portuguese woods are exhibited; and with one exception, none of them are of very great importance. The Marquis de Louis (553-578, p. 1314), contributes a small collection of 24 specimeus, consisting of pine, plum, filbert, wild olive, chestnut, wild pine, elm, numberry, olive, beech, ash, eherry, cypress, carib-wood, cork-tree, holm, poplar, onk, Pilantain, white scaeia, walnut, orange, box, and erategus. For these the Jury awarded a Prize Medal.

Medal for it

- Other specimens of the ordinary woods are contributed from the Rayal Arsenal, from the Ceim Forests, by A. P. F. Vaz (380, p. 1314), and by the Marquis of ICALRO (552, p. 1314).
- Three specimens of wood from Angola and Gen are shown, namely, Tacula-wood from Angola, and teak-wood and sico-wood from Goa. The former, exhibited by the Governor of Angola (590, 1850, p. 1340), is a very remarkably beautiful wood, and which may fairly be called one of the most handsome enbinet-woods known. The Jury accordingly awarded a Prize Medal for this
- specimen.

 A very small number only of Russian woods are shown; n good series of the chief timber lives of the Governments of Grodon, Minsk, and Volkynia are exhibited by A. KALTMANN (117, p. 1370). For these the Jarry awarded a Prize Medal.
- from his oumerous experiments he considers the best, is Specimens of Rhododendron-wood, and plane-tree wood

are shown from Ozoorgethy the GOVERNMENT OF COOTAIS
[134]; the specimens are all cut into the form of
(118, p. 1370), and of walkun and beech-wood, from
books, so as to show the structure of the wood in different
Djarobelecoan by the GOVERNMENT OF TITLES (119, p.) sections, and varnished so as to bring out the colour and open-company by the totyranceper or 1174.5 (15), p. sections, and variabled so as to bring out the colour and Mexicine.

As Spatish words are catalistic; but in the popular of the totyranceper of the word, readers it rather above the colour and t

Besides these, specimens of Pinus orientalis, from Damnscus; Quereus regilops, from Litekoftcha and Walla-chis; Juniperus communis, from Smyrren; Juglans regia, from Damnscus; Quereus coccines, from Rhodes, Morus alba, from Damascus, &c., are also exhibited.

WOODS OF TESCANY

A valuable and excellent collection of Italian woods is exhibited by the ROYAL TECHNOLOGICAL INSTITUTE of TUSANY (47, p. 1294), forming part of the series of Tusacan raw produce, for which the Jury awarded a Prize Medal (see p. 71). The collection consists of two series; the one being of furniture or ornamental woods, the other of timber trees, or woods of construction so out as to show the character of the wood in the best and most instructive manuer; several of the woods are scarce and highly interesting. The collection comprises panel and block specimens.

Some very excellent veneers of walnut wood, cut in a peculiar manner, invented by the exhibitor, are shown by A. Divert, of Florence (99, p. 1298). The Jury nunrded a Prize Medal for these.

VIII, MISCELLANEOUS SUBSTANCES,

Under this head are classed those vegetable substances not properly coming under any of the preceding divisions. It would have been easy to have included in it a very large number of new and little-known products, and of anbstances chiefly interesting as curiosities; the Jury, however, considered that in so doing they would merely increase the lougth of their Report, without leading to any practical result; they have therefore entirely omitted all meution of these substances, and simply here refor to

one or two articles especially deserving of notice.

A very beautiful collection of anatomised plants, flowers, and leaves, is exhibited by E. King (2, p. 195). In these remarkable dissections, the whole of the soft and In these remarkable dissections, the whole of the soft and pulps matter of the plants is removed, and may the plaps in termoved, and may be pulpy matter of the plants in removed, and may of woody times. This effect is produced by steeping the plants in rais-water, in which they are suffered to remain until the whole of the soft parts are decomposed; they make the plants in the plants in rais-water, in which they are suffered to remain until the whole of the soft parts are decomposed; they matter carefully removed with a braith; after this the remaining filtenes part is blueched in a week solution of the plants thiorard of index and itself and the weeks to several months, and its success essentially depends on the minute that the parties of the success essentially depends on the minute that the parties are bestowed in the braising a way of the deposition of the parties are better than the staple, and of fineness and elasticity

composed pulpy matter. The specimens exhibited by E. King are remarkable for their beauty and the very perfect manner in which the whole of the woody skeleton of the plauts has been preserved; the Jury accordingly awarded a Prize Medal far them,

Some excellent specimens of similar anatomised plants are likewise contributed by Lieut. Tellev (5a, p. 195*). These were deemed deserving of Honourable Mention.

Various small collections of dried or preserved plants and flowers are shown by different exhibitors; namely, preserved flowers intended as botanical illustrations, by W. Stevens (3, p. 195*); preserved pitcher plants, by E. W. (Cooke (2a, p. 195*); dried mosses, by M. Rock (3, p. 195*); and dried mosses and sea-weeds by E. Holler (128, p. 205*)

A series of well-prepared and enrefully-dried ferms from Madeirs is contributed by Genoveya Gonsalves (218, p. 1319); this was deemed warthy of Hommrable

Finally, the Jury would specify in this department, as deserving of Honourable Mention, the specimen of selected teazles for the use of wool-dressers, exhibited by ROTSCH and REICHEL, in the Austrian Department (98, p. 1012).

EDWARD SOLLY, REPORTER London, February 1852,

PART II .-- ANIMAL KINGDOM. A .- FOR TEXTILE FABRICS AND CLOTHING.

Woor.

The raw material of most importance and in most general use for the above purposes is Woot. This is a peculiar modification of hair, presenting, when viewed under the mieroscope, fine transverse or ablique lines, from 2,000 to 4,000 in the extent of an inch, indicative of an imbricated scaly surface, on which, and on its curved or twisted form, depends its remarkable felting property and its consequent value in manufactures,

Most quadrupeds possess the woolly variety of hair as

an under-clothing, but in a small proportion, and hidden by the smooth, exterior, coarser, and straighter kind of the woolly variety of hair is developed in excess; and in the wild sheep (Oris answar and Oris musimon) the woolly variety of hair is developed in excess; and in the domesticated breeds the fleece has been modified and improved, in various degrees, by crossing the breeds, choice of climate and pasture, and careful attention and defence during its growth, until not only has the original coarse character of the product disappeared, but quolities of wool of different kinds and of different degrees of of wood of different kness and superiority have been obtained, which are generally divi-sible into two classes—the one better adapted for "carding," the other for "combing," and both available for a great variety of useful and elegant textile fabrics.

In judging of these qualities in the wools exhibited, the Jury have tested the fineness and elasticity of the fibre; the degrees of imbrication of the scaled surface of the fibre as shown by the microscope; the quantity of fibre developed in a given space of the florce; the comparative freedom of the fleece from extraneous matters; and the skill and care employed in preparatory processes; such for example, as that termed "scouring" the fleece, upon which depends its liability, or otherwise, to mut ut the bottom af the stuple.

In these examinations the Jury have to acknowledge the valuable aid of well-versed English and Poreign Experts. After the comparison of the wools exhibited by the growers of different nations, the Jury are unanimous in making the first mention of those transmitted from Germany, as being pre-eminent in the qualities of highest value

Under "German Wools" are included those from Austria and Austrian Silesia, Hangary, Prussia, Saxony, and Polish Silesia,

Austria

of the compouent fibres, the spiral curves of which are close and regular, and are immediately resumed after being obliterated by stretching the fibre, -the length of which is also complerable for wool of this "carding quality, the most valuable for the finest descriptions of eloth. One of the Experts in wool characterises the apecimens, exhibited by Messrs. Figdor and Sons "as a superior and high-bred wool-the fuest and most legitimate specimen in the whole Exhibition." The degree of superiority over some of the wools in the same depart-ment, which was contested by another Expert, was admitted by the first to be slight; whilst opinions were unacimous as to the superior character of the wools, generally, from Austrian Silesia and Hungary, The Jury, therefore, appreciating the difficulty of arriving at a co rect judgment of the degrees of individual merit, especirect judgment of the degrees of individual merit, especi-ally from samples giving on innectain indication of the average value of the produce of flocks, came to the con-clasion of recommending the award of the Consell Medal, as notified in the Second Section of the Report, so as to signify their appreciation of the highest elses of words, and to distinguish the manifestly superior qualities of the wools exhibited by individuals by the award of the Prize Medal; and they place first on the list the firm of MM. ISAAC France and Sons, of Vienna.

ISAAC FIGDOR and SONS, of Vienna,
COUNT H. LARISHM MONINGER (92, p. 1012).—The
product of a flue and well-known flock, from Niksia, exhibited by four fleeces, which present similar exclude
qualities to those of No. 90, the difference, on the whole,
being so slight that the Jury also award the Prize Medal

to Covy II, Laussen Modynten, of Silesia.

CONYA TAYON YON MITTANOWN (9), p. 10127.—These
fine and high-bred fleeces of a pure merino flock, from
Silesia, exhibit the valuable qualities of fineness and
elasticity of fibre in so eminent a degree that the Jury
award the Prize Medal to their exhibits.

COUNT JORGH HEYADAY VON KETHILKEY (89, p. 1012).

—The fleece, from a fleec in Hungary, is an unwashed specimen, but of a very fine quality of fibre; it is a little inferror to the lest Silvain examples only in being some what thinner or poorer in substance. The fine inheration and elastic properties of the fibre are, however, so remarkably characteristic of this freece, that the Jury navard to its exhibitor the Prize Medal.

The washed and unwashed wools exhibited by COUNT O. von Wallis (93, p. 1012) (Bohemia), and by Messen. PANNA and Alexis, (94, p. 1012) (Transylvania), present qualities which entitle them to Honocarable Men-

Zollverein.

W. Geart (803, p. 1094).—The fleece of wool exhibited on a stuffed sheep from the merion fleek of this exhibitor, at Minchenhoff, merits, from the flueness and eloseness of the flue and its excellent "carding" qualities, the award of the Prize Medal.

LEGATIONS-RATH KUEFFER (29, p. 1049).—The merino fleeces of two-year old ewes, from thromberg, here exhibited, are remarkable for the fluences and regularity of the staple, and illustrate favourably the advance of the improvement of wool in the Prussian districts of the Middle Visitula: the Jury deem them to merit the award of the Prize Medal.

B. LTERNIE (24), p. 1049).—The fleeces transmitted by this exhibitor from Zeveptodi, nor livedu, are very remarkable for those qualities which, like the Austrian-Sitesian woods, adapt them for the flabrication of the finest eloths, and the Jury award to Mr. LCHREAT the Prize Medal.

G. L. NORDMANN (30, p. 1049).—The fleeces from Liszkowy, near Mowraelaw, are also fine specimens of Pransian wooks, remarkable for the great regularity in the staple, and meriting the award of the Prize Medal to M. Noarmann.

ORTHIGAGE AT YOU BRUNNER, (45 and 46, p. 1050). clothing — The Secces of a run and a ewe from a merino flock at Bellschwitz, and the specimens of wool indiscriminately taken from a merino flock at Roesuberg, though rather inferior in quality to the fluest Silesian wools, manifest a fineness, otheres, and elasticity of fibre (Class XII.

and a regularity of staple which, in the opinion of the Jury, merit answard to the exhibitor of the Prize Medal. The Belleshwitz flock was procured by the Oberburggraf in Syain in 1814, and afterwards improved by additions of the finest Naxon and Silesian races in 1820 nod 1824.

M. Ockel, for the Royal Administration of Frank-Entring (27, p. 1049).—The fleece of a rain and of ewes shorn in the spring of 1850, and the samples of wools from the flock kept at Wrieten on the Oder, under the above Administration, manifest qualities which the Jury have considered to entitle the Administration to the

awaind of the Print Modal.

Of other children in the Zadaveria, Baron Of the other children in the Zadaveria, Baron Of the other children in the Company of the staple in two examples of weal in florent (Ceru Normania (S.), 1943), for the florency (Ceru Normania (S.), 1943), for the florency of the staple in two examples of weal in the Company of the

United States of America.

Mr. Cockerll, The wool transmitted by this exhibitor from Northville is well got np, and exhibits, like the preceding specimens, a quality of fiber, indicative of care and skill in the development and improvement of the force which selfs for the present of the present of the force which selfs for the present of the pre

fleece, which calls for the award of the Prize Medal, Mr. J. II. Eversc (18s. p. 1449).—The wool, transmitted from Washington, Pennsylvania, by this exhibitor, is remarkable for the good substance of the fleece, as well as for the quality of the fibre, and the Jury award to birn the Prize Medal.

Messrs, Kismen and Co. (500, p. 1466).—The specimens of fine clothing wool, exhibited by this firm, also develop qualities which merit, in the opinion of the Jury, an award of the Prize Medal.

Messrs Powers and Brown (201, p. 1440).—The

Messrs. Pseuctss and Brown (201, p. 1449).—The samples of fine combing wool transmitted from Ohin exhibit qualities which merit the award of the Prize Medal.

Russ

N. N. SCHLOSS-TAIKATEN (128, p. 1370).—The specimens of wool from Livonia here exhibited appear to be derived from a flock of Silesian origin, and manifest all those characters of the fibre which adapt it for good clothing purposes; and the Jury award to the exhibitor an Honourable Mention.

Ansong other examples of wool of a good and valuable

 This Firm's name is inserted in the Award List of ass Xtt. quality in the Russian Department, the Jury select, as deserving Honourable Mention-T. Gamalet, of Bessarabia, district of Ackerman (123, p. 1370), samples of the merino breed; - VASSAL, of Tauride, district of the Dnieper (122, p. 1370), specimens of meriuo wool;-L. & F. PUILIBERT, Tauride, district of Melitopol (124. p. 1370), specimens of merino wool;—A. Aknoonporr shah Mirza, of Stavropol, district of Pintigersk (126, p. 1370), specimens of white and black wool, unwashed; -8. Groolo, of Gork (130, p. 1370), for specimens of black wool, nawashed;—The Farm or Gontowartza, of Mohileff (121, p. 1370), for specimens of merino wool; Mahomet Khan Yorznasu, of Derbent, in the Khanate of Kinrin (129, p. 1370), for specimens of white wool, unwashed: -J. ABRANOFE, of Eksterinoslaff (131, p. 1370), for his examples of fine unwashed Cashmere goats' hair;
—and L. K. Nanissikin, Saratoff, district of Balasheffsk.

J. L. GRAUX (245, p. 1188).-Council Medal. The specimens of the new variety of wool exhibited by M. Graus and which have been deemed worthy of the recommenda-tion of the Council Medal, have already been noticed in

the Second Section of the Report.

LE GENERAL GROD (OR L'AIN: (1249, p. 1237).—The fleeces of merino wool, from the exhibitor's flock at Nut. although of a thin staple, and apparently not full-grown, display the qualities adapting it for the finer descriptions of cloth in so excellent a degree, that the Jury award to Général Girod (de l'Ain) the Prize Medal.

NATIONAL SHEEP-toLo of RAMBOULLET (1986, p. 1230),—The qualities of the four fleeces of the true merinos, exhibited by this valuable institution, have also been considered such as to merit the award of the Prize

E. Lerevae (345, p. 1239).—The specimens of wool in tufts transmitted by this exhibitor from Gevrolles (Coté d'Or) are long in the staple and very sound, forming a very superior description of combing wool, and, as such, deserve the award of a Prize Medal. F. RICHER (354, p. 1194).—The two fleeces of rams,

of pure meriuo breed, two years old, transmitted from Gonvix, Calvados, have also appeared to the Jury to merit, in the comparison of the wools from France, the award to M. Richer of the Prize Medal. The exhibitors of wools in the French Department

whom the Jury would distinguish by Honourable Mention are-Eggarage and Sox (142, p. 1178); Majorte and Son (900, p. 1223); MM, Baungara and Son (38, p. 1173); for the specimens of combed wool, spun by an apparatus of the exhibitor's construction, M. Malingie 22, p. 1192), for the fine combed wool, the produce of a flock reared at the Agricultural School of La Charmoise, Pont Leroy (Loire et Cher); MM. LAROQUE and JAQUEMET (901, p. 1223), for their assortment of spun wool for knitting blankets; G. RIVAUE, of Petit Rochefort (987, p. 1226), for his good fleeces of merino wool; V. E. Waamont (1048, p. 1229), for his specimens of wood in skeins; MM, PATURLE-LUPIN SEYDOUR, SKINER, and Co. (1381, p. 1242), for their samples of cleansed wools; J. A. Lenasson DE MONTLEAU (1498, p. 1248). for his fleeces of merino wool; and MM, BERNOVILLE, LABSONNIER, and CHENEST (1548, p. 1250), for their eaamples of cotaled wool and woollen varu.

Spain.

D. JUSTO HERNANDEZ (230, p. 1344).—Of black and white wool from Salamanca four samples have been transmitted by this exhibitor:—1. Unwashed wool for elothing purposes; 2, Unwashed wool for worsted; 3, Wool washed before shearing, in the Saxon manner; 4. Wool sheared in Pebruary, 1851. M. Justo Hernandez has introduced into Spain the custom of clothing the sheep from the beginning of December to the end of May; and amongst the specimens transmitted to the Enhibition is a fleece which has been so defended, and one that has been exposed to the direct influence of the utmospheric been exposed to the difference in the quality is remarkable, and speaks decidedly in favour of a temporary protection of the fleece. The good qualities of most of these

specimens of Spanish wool have appeared to the Jury to merit for D. Hernandez the award of the Prize Medal.
Of other samples of wool traismitted from Spain the
Jury select as deserving Honourable Meation — (225,
(p. 1345), S. MONLERO, of Seville, for his samples of fine unwashed merino wool; and (226, p. 1343), the Province of HUELA, for the good quality of wool exhibited from the flocks fed on the Sierra de Audevalo,

United Kingdom of Great Britain and Ireland, C. DORRIEN (11, p. 201*) .- The samples of wool transmitted from Chichester, by this exhibitor, give evidence of a very high-bred flock, and manifest qualities of fibre, for which the Jury award the Prize Medal.

for which the Jury award the Prize Medal.

R. Millarse (85, p. 201¹).—The fleevest, showing a long staple, grown in the consider of Meath and Galey, support in the consider of Meath and Galey, county of Wicklow, exhibit qualities of fibre for which the Jury award the Prize Medal.

J. G. Rizon (84, p. 201¹).—The specimens of wool from the Southdown breed also exhibit qualities of and excellence as to call for the award of the Prize Medal.

The fleeces of Cheviot wool, grown at an elevation of .600 feet above the level of the sea, cabibited by Mr. HENDERSON, of Wooler, Northumberland (80, p. 201*), are remarkable for the fine silky quality of the fibre, which is well adapted for the blanket unnufactory. The Jury regard these specimens as deserving Hononrable Mention. The Jury also desire to record Honourable Mention of the fleeces of fine German wools, exhibited by Mr. C. Lappert, of Leeds, under 97, (p. 2017); and the series of wools shown by Mr. Chersenorous, of

An object of curiosity is shown in the English Depart-An object of curiosity is sawwith to be suggested as ment, being a Sonthdown ewe, stuffed, seven years old, which had never been shorn. The weight of the accumulated annual fleeces was 36 lbs. This specimen is exhibited by Mr. J. Moong, of Littlecott Farm, Pewsey, Wilts (78, p. 201).

Australia.

Lieut.-Col. E. Macanthen (13. p. 989, 990).-The case, containing 132 speciatens of merino wool, exhibits very favourable examples of the condition of the fleeces of that valuable variety of the sheep in New South Wales, The Jury regret that the quantities transmitted are too small to afford the requisite means of judging of the uverage qualities of the flocks; but, taking into consi-deration the important services readered by Lieut, Col, Macarthur to the colony by his persevering and successful endeavours to develop a sonree of wealth from the merino breed of sheep, the Jury award to him the Prize

Medal. The first importation of wool from New South Wales into England in 1807 was 245 lbs. In the year 1848 the quantity from New South Wales, glone, amounted to 23,000,000 Bs., valued at more than 1,200,000/.

The Jury desire to enpress, by Honournble Mention, their opinion of the good qualities of the wools exhibited by Mr. T. Learnonth (6, p. 989), marked (T); by

Messrs, Stevens and Thomson (347, p. 999) (47); and

by Mr. GRANT, of Tasmania Cape of Good Hope,

With regard to the wools exhibited from this colou Nos, 31 and 32 are fine samples, but are too small in quantity to sopport a judgment us to the average value of the fleece from the flock. The Jury, however, regard the samples transmitted by RETZ, BREDA, and CO. (30, 950), and by D. G. Van Breda (32, p. 950), as de-erving Honourable Mention. p. 950),

The specimens of wool, the production of Cachemere goats kept by His Royal Highness Paince Albert, at Windsor, and cabibited by His Royal Highness, are examples of an additional staple new to England, and give encouragement by their quality to the repetition of similar efforts to multiply and preserve that remarkable variety of the genus Capra. This staple includes, besides the closer and finer hairs answering to the wool of sheep and the far of other quadrupeds, a coarser or stronger kind of white hairs. Both kinds are of value in manufactures—the stronger hairs, which require to be picked out prior to attempting to manufacture; the five portions being afterwards used in the fabrication of coarse woollen cloths. This example of Enropean Cachemere wool would have received a Medal from Jury IV had not one been already awarded in it by the Jury of Class XII.

HAIR AND BRISTLES.

Russia

The best developed and most valuable examples of these productions are exhibited in the Russian Department, in which the Jury select-

HASILE KOUDRIAFIZERY JAMESOFFSKY (340, p. 1382), for the award of the Prize Medal, merited by the sa-perior qualities of the horse-hair exhibited by him under that number. In the sample of white hair from the tail, the hairs are 40 inches in length, and of the first quality for evenness, elasticity, and shining surface. In the sample of black tails, the hairs are 42 inches in length. Fire specimens of white hair from the mane, of length. from 28 to 30 inches in length, both transparent and opaque, and good samples of horse-hair for firmitare, both drawn and curied, black, grey, and white, are also

shown by the above Exhibitor.
Of the samples of bristles exhibited in the Russian Department, the Jury select—
SEMESOF and FALEYER (135, p. 1370), as deserving, from the superiority of the combined qualities of strength, elasticity, and flueness of surface, the Prize Medal. These qualities are particularly shown in the packets of the sorted variety called "okatka."

The Jury regard as deserving Honourable Mention the fine-textured and well-formed bristles shown by the pensants Koriakin and Monoikoff, of Vologda, under (134, p. 1370); and the selected bristles, of different qua-lities, shown by J. Zolotorest, of Kalonga, under 136 (p. 1370); the prepared horse-hair for nuttresses, shown by A. Beznoukavnikorr-Sokolorr, under 248, (p. 1374); and the plames of horse-tails, and black bufffalo tails, exhibited by P. Ivanorr, of St. Petersburgh, under 159, (p. 1375).

Belgiam

Among the examples of hair and bristles transmitted from Belgium, the Jury deem worthy of Honourable Mention samples of hogs' bristles, prepared and bleached for painting-brushes, exhibited by H. HAUSSENS-HAP, of Villoorde (257, p. 1159); and the samples of horse-hair, horse-tails and manes, and pigs' bristles, shown by II. SOMZE-MAHEY, of Liège* (265, p. 1159).

MM, CATZ and Co. (30, p. 1144).-Specimens of drawn horse-hair for fiddle-sticks, and horse-hair for stuffing fur-niture, show qualities deserving Hanourable Mention.

Zollverein.

H. Fudikar, of Elberfeld (596, p. 1083). Specimes H. PEDBAR, of Elberfeld (2008, p. 1083). Speclineous of horse-bair for upholstery purposes, deserver, for their fine and equal texture and elastic qualities, Honomable Mention; and the Jury also award the same distinction to GOTTLIER FORSET (813, p. 1095) for his well-selected series of hogs? bristles and peleked hogs? hair from Halle.

Spain.

D. D. DELGADO, of Saragossa (231, p. 1344).—This exhibitor has transmitted some interesting examples of the hair of the rabbit and hare, shaved off the skin by a mechanical process. The vast numbers of those prolific

* These exhibitors receive Medals in Classes XVI. and XXVIII., in whose Award Lists their names appear.
† This exhibitor receives a Prize Medal in Class XXVIII., In whose Award List his name appears,

rodents in Spain would ufford a large supply of this kind of hair; and the Jury desire to signify their encourage-ment and approbation of D. Delgado's industry by making Hoseurable Mention of these specimens,

WHALEBONE.

The substance so called is closely analogous, in its chemical and physical properties and mode of growth, to hair and bristles, but is developed in compact plates which resolve into stiff bristles, at their free margin, from the thick gum at the circumference and palatal surface of the apper jaw of the animals of the whale tribe. The most valuable kind of whalebone is obtained from the great Arctic whale (Bulean systicatus), in which the platte or 'blades' are arranged in several rows, the outer-most consisting of the longest plates, attaining, in a full grown whale, the length of from 8 to 12 feet.

England,

Mr. HENSY HORAN (103, p. 201, 202). - This exhihitor shows well-selected examples of whalebone plates from the Arctic whale (Balana mysticeius), which yields the largest and best kind; from the Antarctic whale (Balana australis), which uffords the second best kind; and from the great finner whale (Bulamoptern Boops), which allows the shortest and coarsest plates. With these examples of the raw material, Mr. Haran exhibits specimens in various states of preparation, and numerous and ingenious applications of the prepared whalebone, of and ingestious apparations of the prepared understood, in different colonis, as, e.g., for covering whip-handles, walking-sticks, and telescopes, and in the form of shavings for plaining, like straw, in the construction of light lasts and bonnets. The Jury, taking into consi-deration the illustrative collection of this new material is connexion with its various applications, adjudge to Mr. Horan the Prize Medal

Horan the Prize Media W Ext.AL and Co.* (104, p. 202*),—The same grounds which are specified in relation to No. 103, sustain the ward of the Prize Medial to Mr. Westall, in whose col-lection the Jury have to specify more especially the great variety of filamentary modifications of the whaleone material for numerous useful applications

The fine blades of whalebone from the Balana mysticetas, exhibited in the United States Department, under 537, (pp. 1467, 1468), by Mr. L. Gondann, deserve Ho-nourable Mention, as do likewise the specimens of Balen plates from the Bulana australis, exhibited by Mr. S. Mosss, under Nn. 237 (p. 997), from Van Diemen's Land.

The most valuable kind of Silk, and that which is the subject of the most extensive and pains-taking culture, is a secretion of the larva of a species of moth, indigenous a secretion of the larva of a species of moth, indigenous to China, called, par excellence, the "silk moth," and by entomologists, Bondyx mori, from its native and favourite food, the leaves of the mulberry tree. The species was first introduced into Enrope in the reign of the Euperor Justitulan, by two Nestorian monks who had travelled in China, and who succeeded in hrighing a quantity of eggs, secured in a hollow cane, to Constantinople, where they were hatched, and the larvæ fed and reured on the leaves of the white mulberry. The breed-ing of silkworms in Europe was confined for six centuries to the Greeks of the Lower Empire. In the twelfth century the rearing of silkworms and the manufacture of silk were introduced into Sicily; in the thirteenth cen-tury into Ituly; whence this important branch of in-dustry has been successively established in Spain, France, England, and most of the colonies with a suitable cli-

site. Silk is a secretion of a pair of long glandular tubes which terminate in a prominent pore or spinsaret on the under lip. Before their termination they receive the secretion of a smaller gland, which serves to glue together the fine filaments from the two 'serieteria,' the apparently single thread being in reality double, and its ounbity being affected by the quality or difference between

* These exhibitors receive their Medals in Class XXVIII... in whose Award List their names appear.

the secreting power of the twn serieteria. worm commences spinning when it is full grown, in some convenient spot affording points of attachment for the first-formed thread, which is drawn from one part to the other until the body of the larva becomes loosely en-elosed by the thread. The work is then continued from one thread to another, the silkworm moving its head and spiuning in a zigzag way, in all directions within reach, and shifting the body only to cover the part which was beneath it. During the period of spinning the cocoon, which usually takes five days for its completion, the silkworm decreases in size and length considerably; then casts its skin, becomes torpid, and assumes the form of the chry-

The main object of the silkworm breeder is to obtain cocoons of a large size, composed of a long, strong, very fine, even, and lustrous thread. These properties of the silk have been realised in the highest degree in the speeimens transmitted from France, in which country the development of the silkworm has for a long period exerdevelopment of the silkworm has for a long period exer-ised the care and pains of many able breeders, and of late years has been the object of systematic advancement by the Courts Society of Serticienture of France. The Bombys word, having been bred and reared under the special care and management of man during a long suc-

cession of ages, may be regarded as a domesticated species of insect; and it has become the subject, as in the higher domesticated races of varieties—of which those called 'Sina,' 'Syric,' and 'Novi,' in France, are examples. The 'Sina' variety of the silkworm is known and

esteemed for the pure whiteness of its silk, the thread of which is fine, but weak, and not very lustrous. "Syrie' variety is of large size, produces a cocoon abundant in silk, but the thread is rather coarse, and inclines to a greenish tint. The 'Novi' race is small, but the to a greenish tint. The 'Novi' race is small, but the cocoons are firm and well made, and the silk is lustrous, but has a vellowish tipt,

The specimens of silk exhibited in the French Department are numerous, and the degrees of excellence hardly ment are numerous, and the degrees of excellence hardly to be discriminated in the fluset examples selected for the award of the Prize Medal. In specifying the names of the exhibitors so distinguished, the Jury propose, therefore, to limit themselves to the mention of the more remarkable eircumstances which they have found to be associated with certain examples. The Jury select, as the first in order of merit-

Major Court DE Baonno Baonsez (782, p. 1218), exhibitor of unbleached silk and silk eccoons from the Chiteau de St. Selves, near Bordeaux, Department de la Gironde. The eocoors are remarkable for their large size and regularity of form, and the silk for the unusual size and regularity of form, and the silk for the unnasan length of the thread, its natural pure white colour, its fineness and fustre. The circumstances under which this superior quality of silk is obtained are certified—in a Report by a *Committee of the Agricultural Society of the Girosoft, signed Philippar, and dated 28th April

1847-to be as follows:-

in 1836, Major Bronski reared separately the eggs of the three varieties, 'Sina,' 'Syrie,' and 'Novi,' Is and 'Novi;' and on the exclusion of the image, or per-fect insect, he associated the males of the 'Novi' with feet insect, he associated the manes of the front with the finalise of the 'Syrie; and the hybrid ova were hatched at the ordinary period in 1838, the same opera-tions being repeated in 1839 and 1840. With regard to the race 'Sins,' M. Bronski, in 1857, separated the white from the black worms as soon as they were hatched. He then selected the largest and best-shaped cocoons, and made a special collection of the eggs from the moths excluded from those cocoons. This procedure was repeated in 1838 and 1839; hat in 1840 be associated the males ex-1838 and 1859; not in 1840 he associated the issues ex-cluded from the large ecocons of the black worms with the females excluded from the largest ecocons of the white worms. In 1841 he associated the make of the 'Sina' race with the hybrid females obtained from the abovedescribed crossings of the 'Novi' and 'Syrie' hreeds,

By these and similar experiments M. Bronski at length appears to have succeeded in obtaining a race of silk-

worms not subject to disease, producing a large and equal sized ecoous of a pure white colour, the silk of which is equal in all its length, strong and lustrous, and which is certified to present an average length of thread of 1057

metres (1154 yards English). The Jury, in awarding the Prize Medal to Major Count Bronski, desire, at the same time, to give expression to their unanimous opinion as to the importance of the resumption, by the highest administrative and scientific authorities in France, of those investigations which had been entered upon with a view to determine the stability and commercial value of the results of M. Bronski's experiments and discoveries in the amelioration

of the breed of silkworms. The French exhibitors of silks of fice qualities are merous: and amonest these the Jury award the Prize

Medal to-MM. ALCAN and LIMET (1050, p. 1229); in regard to whom the Jury desire to express their approval of the new mode of 'filature à froid,' and of the mode of diworm (Tussar), both of which insprovements are due to

MM. Alcan and Limet. MM, ARDUN and CHANCEL (S. p. 1170). C. Brauvats (1076, p. 1229), to whom the silk-ounn-factors in France owes much, for his establishment of a school of sericiculture, for diffusing the true principles on which the development, breeding, and improvement of

Sardinia.

to the Department of Sardinia, the Jury have selected deserving, for their excellent qualities, the Prize

CLASS I

Medal, the silks exhibited by,—
Cassaa and Soots (27, p. 1303); II. Jacquer and Co.
(28, p. 1308); Rioson and Co. (30, p. 1305). And the
Jury repard as deserving 'Honourable Mention' the exam-

ples shown by :--BORZONE, J. (45, p. 1304), MICHAEL BRAVD (24, p. 1303) IMPERATORI BROTHERS (38, 1303)

Sinigaglia Brothers (25, p. 1303). Austria.

In the Department of Austria are exhibited some fine examples of Italiau silks, from which the Jury select for the award of the Prize Medal :-

G. QCERINI, Venice (84, p. 1012), SCHERULER and Co.,* of Milan (80, pp. 1011, 1012). VEREA BROTHERS, of Milan (87A, p. 1012).

YERAM HIGGERICA, OT DILLING (87A, P. 1012).
From Austria Proper the Jury also consider the Silambor Remains Association of Gratz, Styria, as highly deserving the Prize Medal, for the specimens exhibited by them noder No. 75, p. 1011.
The exhibitors of raw silk deserving Hosourable Men-

tion are:-BOZZONI BROTHERS, of Riva. G. B. MATTIUZZI, of Varmo, Friuli (77, p. 1011).

A. Scola, af Upper Austria (72, pp. 1010, 1011). F. Seccui, of Milan (81, p. 1012). SENIGAGLIA and CARMINATI, of Parma, Friuli (78, p.

G. STRINER and Sons, of Bergamo (87, p. 1012). Prussia

The Jury wish to distinguish by 'Honourable Meution' the specimens of raw, white, and spinning-silk, protion the specimens of raw, white, and spuning-silk, pro-duced in Berlin, by means of a banging spinning-hive, no the principle of bec-hives, invented by the exhibitor, A. M. Bolzaki (38, p. 1080), by the use in which no double occooss can be produced. And also the specimens of silk exhibited by Kiszkwski (39, p. 1050).

Russin

From the examples of silk transmitted from Russia, the From the examples is size transmitted from massia, the Jary select: Riyan (138, p. 1370), from Tauride, district of Molosuchansk, as exhibiting the finest quality of the thread, and as meriting the award of the Prize Medal, And as deserving 'Honomable Mention' !--

A. REPROFF, of Stavropol (159, p. 1370); and M. RAYKO, of Odessa (140, p. 1370).

Turkey.

The silks exhibited in this Department arc, many of them, of a very fine character, exhibiting a good length of thread, with the qualities of fineness, strength, elas-ticity, and hastre. The Jury select, as meriting the Prize Medal, the following exhibitors: MOUSTAPHA NOURI PACHA, of Broussa (1764, p. 1387),

J. PAULARY, of Brousen (1711, p. 1388). Scott of Schemlan, Mount Lebanon (60, p. 1387

THE SCHOOL OF SERICICULTURE AT BROUSSA (1388). The Jury desire, in same manner, to distinguish the excellent specimens of raw silk and of cocoons exhibited by Michigatra Diezairolov (159, p. 1387), and by Morour and of Co., Beyrout (191, p. 1387).

A Prize Medal is awarded to-Prilove, BRENTANI, and Co., of Augsburg (36, p. 1100).

The specimens of raw silk exhibited by W. JAKGER

and Co., of Messina, exhibit the best qualities, and merit the award of the Prize Medal.

 These exhibitors receive Medals in Class XIII., in whose Award List their names appear.

Sweden,

Among the specimens of raw produce transmitted at a late period of the Exhibition from Sweden, the Jury desire to particularize, as meriting Houourable Mention, the fine examples of raw silk exhibited by Her Majesty the Quexa of Sweden (1348).

India.

Very fine examples of silk are shown in the Indian Department, from which the Jury select, as meriting the Prize Medal, the following exhibitors:—

D. Jardine, of Calcutta (p. 891). C. R. Jennikos, of Commercelly (p. 892). Mackenzie Brothers, of Bergal (p. 892). W. McNath, of Sardah, Bergal (p. 891).

Warson, of Nardah, Bengal p. 93).

Warson, of Nardah, Bengal p. 93).

En special Mention.

The raw silk from Persia exhibited by Mr. Thomson, Che raw silk from Persia exhibited by Mr. Thomson, Che raw silk from Persia exhibited by Mr. Thomson, The raw silk from Persia exhibited by Mr. Thomson, The raw silk from Persia exhibited by Mr. Thomson, The raw silk from Persia exhibited by Mr. Thomson, The Research of Persia exhibited by Mr. The Re

China

China.

In the Chinese Department, the quality of the silk developed in the native country of the silk worm is worthly illustrated by the specimens exhibited by YUN-KEZ, of Shang-hac (p. 1418), to whom the Jury, therefore, adjudge the Prize Medal.

The Jary regard the specimeus of silk, exhibited in this Department, by Messer, Astral, and Co. (p. 1422), Mr. C. J. Beaute (p. 1424), Mr. Hammon (p. 1425), and Mr. Lindsax (1422), as severally meriting Honourable Mention.

Mauritius.

In this colony the cultivation of the silkworm has been greatly promoted by the company formed by the exercions of M. E. Duvovr, of Port Louis (2, 986), and the Jury award to him the Prize Medal, for the excellent qualities of the white silk which he has transmitted. Amongst the specimens of raw silk from the Roman States the Jury fluid worthy of Homorable Mention:—

States the Jury had worthy of Honourable Mention:— D. Bernetta (6, p. 1285), and M. Bolgain (38). In those from Malta the Jury award Honourable Men-

G. Pulis (4, p. 944).

England. The specimens of silk, from silkworms reared on leaves

of the white nulberry, at Goldnoing, Surrey, and exhibited by Mrs. Carrisans Doma (32, p. 197*), possess qualities which, considering the unfavourable conditions of climate, have deserved, in the opinion of the Jury, Honourable Mention.

The Jury regard the raw silk exhibited in the Cam-

The Jury regard the raw siik exhibited in the Canndian Department, by Messrs. MacKay and Co. (144, p. 966), as deserving Honunrable Mention.

FEATHERS AND DOWN.

An instructive and comprobasive eatlicetion of feathers and down, in different sates of preparation for bed-string, including English goose feathers, first goose and and one, and the sate of the sat

Mesars. Blyth, Hamilton, and Blyth (60, p. 199*), exhibit excellent examples of purified English white goose feathers and of Irish white feathers, for which also the Jury award Honoumble Mention.

In the Russian Department good specimens of white Bejotsk bed-feathers, grey feathers, and goose-down are

exhibited by J. Larsmy (145, p. 1371), of St. Peters-

burgh.

Madame Laddonin, of Tamboff (283, p. 1375), exhibits
a fine quality of down from the breast of the goose; together with articles made of goose-down.
A. Power, of Mescow (144, p. 1371), also shows down

of the first quality.

Each of these exhibitors deserves, in the opinion of the Jury, Honourable Mention.

B.-FOR DOMESTIC OR ORNAMENTAL PUR-POSES; OR FOR THE MANUFACTURE OF IMPLEMENTS.

Otla, Wax, &c.

A class of substances was exhibited under the head of 'cids,' which are likely to prove of great commercial importance, as they possess properties differing from the finest vegetable oils, and some of them e.g., it appears, be supplied, in large quantities, and its moderate costs. The surgical in large quantities, and its moderate costs. The class, awarded as Price Media for, Lanaczec, Cape of Good. Hope (13, p. 390), for oil obtained from sheep's talls, and 'Honourable Medical' to (5, Domasce (21, p. 144); T. Essouri (18, p. 1449); F. Passay (19, p. 143); T. Good (18, p. 1449); T. Good (18, p. 1449); T. Arabino (18, p. 1449); T. Arab

pernuture.

Honourable Mention was also awarded to C. A. Jarry,
Canada (100, p. 965), for oil obtained from peopoies, and
which is used largely for lighting parpose; to C. Kounn,
Prussia (337, p. 1070), for a sample of oil exhibited by
him.

A Medal was awarded to Mosze, Soe, and DAVIS, New South Wales (15, p. 999), for tallow, Some fine white waz was exhibited in the Portuguese Department by M. F. Barray (60x, p. 1314); both were awarded M. L. De Carvanto (617, p. 1314); both were awarded to wise awarded to M. Cittus Martin Bestions were likewise awarded to M. Cittus Martin Bestions were likewise awarded to M. Cittus Martin (1981, p. 998), and P. R. W. Borr, Van Diemen's Land (1981, p. 998), and P. R. Vissan, Nebrethinds (17, p. 1143), for the samples of wax

HORNS AND ANTEERS.

exhibited by them.

Of these productions a great variety of fine and illusstrative sperimes are exhibited, amongst which the cutlection in the Indian Disparament (p. 802) merits the first at the control of the 'barn sinha' ('Ferna Dismonthi'), of the 'Samber' Cerea highespleas, of the 'harder' is builting dee 'Cerea programs, of the 'Barn,' and other species,' laters,' of the 'mar' ('Oppriornia behalfun' of the 'bagder' ('Cerea premiss, of the 'Barn,' and other species of 'Cerea premiss, of the 'Barn,' and other species ("Ber abdoha", of the 'gour' ('Ber curif'you,') of the 'spat', and of either kinds at Tollan halfalls, or, and

(1942 observed), or the good (1966 confirms), of the good of other kinds of Indian huffato, ox, and antelope, were also exhibited.

Cisaoda.—A pair of fine moose-horns (Alces Americano) are shown in No. 99, and a second pair, Nu. 237.

canoun.—A pair of the moose-horns (Alees Assertion) are shown in Nn. 99, and a second pair, Nn. 237, p. 963, hy Mr. J. Thomrsox, of Three Rivers.
From the Cape of Good Hope fine buffalo horns are shown in No. 16, p. 250, hy Mr. Merssen; and rhimoceros horns, in No. 28, p. 390, by Mr. Harneray.

norms, in No. 2e, p. 930, by SIT. HANDERY.

From Egypt have been transmitted horns of the bull and buffalo, uf antelopes, and of the two-horned rhinoceros.

It does not appear that any of the specimene achilies improvements or size or texture as the consequence of modifications in the food or habits of the species, super-induced to that end by the art of mass. The functions of the consequence of human ingenuity and skill, find no exercise in regard to the present class of ms materials, and the Jary therefore infait themselves to the above sections of the materials of the materials of the section of the sec

The same considerations necessarily limit the functions of the Jury with regard to the tusks of animals presenting the modification of dental substance to which the term is applied. Fine tvory, distinguished by the decresating curved lines on the surfaces of transverse fractures or sections of the tusk, is peculiar to the African and Asiatic elephant, among existing quadru-peds, and the best is obtained from the wild individuals; domestication of the elephant, in India at least, having been usually attended by deterioration of the length and

quality of the tusks. The finest specimens of elephants' tusks are a pair The most specimens of explanats tracks are a pair weighing 325 lbs. of the Elephas Africanes, obtained from an animal killed near Lake Ngami, in South Africa; each tusk measures 8 feet 6 inches in length, and 22 inches in basal circumference. A single task, weighing 110 lbs., from the same locality, is associated with them. These specimens are exhibited by Mr.

JOSEPH CAWOOD (p. 952), to whom the Jury award Honourable Mention

Messrs. FAUNTLESON and SONS, Potter's Fields, Tooley Street, exhibit an instructive collection of elephants tasks in No. 135, pp. 205*, 206*. The largest of these is from the African clephant, and weighs 139 lbs. Varicties of tusks are also exhibited from the Gold Coast, the Gabson River, Zamibar, the Cape of Good Hope, Angola, Alexandria, Ceylon, and the East Indies. The mode of implantation of the tasks is illustrated by the skall of the African elephant. Of the tusks which exhibit a deuse texture, but have not the engine-turn markings of true ivory, Mesura. Fanntleroy exhibit those of the 'narwhal,' the 'walrus,' and the 'hippopotamus;' and the Jury regard this instructive collection as deserving Honograble Mention

Fine tusks of the Ceylon variety of elephant are shown in the collection from that country; and several example of the continental Asiatie kinds are exhibited in the Indian Department, among which may be noticed some Indian Department, among which may be noticed state tasks of the Siamese elephants, one of which weights 100 lbs., and shows a fine white compact kind of ivery. Mesars. Buchanan and Law (p. 952) exhibit, from the

Cape, an elephants' tusk weighing 103 lbs.; and Messrs. HUTTON and Sons (p. 954), show every from Dahomy. TORTOISE-SHELL

The substance, so called, consists of certain large hornlike epidermoid plates, which cover, in an imbricated or overlapping manner, the campace or back-shell of the marine tortoises or turtles (Cheloss). The species which afford the most valuable of these plates are—the 'Karet' tortones or imbricated turtles (Chelone imbricata, Chelone caretta), from which are obtained 5 large plates off the middle of the carapace, and 4 large ones off each side madate of the carapace, an innuber, are technically called 'hlades;' 25 smaller plates are obtained from the margin of the carapace, which are called the 'feet' or 'noses,' in commerce. The other plates, collectively, are called the 'head' of the turtle.

Fine specimens of 'tortoise-shell' have been sent for rine specimens of tortone-serial may be been sent for exhibition from Trinidad by Lord Hanns (p. 973); of which, as well as of those sent from Labana by Mesors. Ilamsoon and Co. (p. 988), and from Ceylon (p. 938), the Jury desire to make Especial Mention.

PEARLS.

These precious substances are the result of an excretion in superimposed concentric lamina, of a peculiarly fine and dense mercons substance, which consists of membrane and carbonate of lime. The finest quality of pearl is produced by the hivalve of the Indian Seas, called 'por excellence' the 'pearl-oyster' (Meleagrisa margaritifera), fine specimens of which are exhibited in the Indian and Ceylon collections,

Pearls of an inferior description, formed in a fresh-water hivalve (Unio margaritifera), are exhibited under No. 15, p. 122, Class L by John Nells, of Omagh, county Tyrone, from specimens obtained from the deepest parts of the river Strole, near Omagh. Similar pearls, also found in the Unio margaritifera, from the

river Ythan, Aberdeenshire, are shown under No. 16, p. 122, Class I, by Messra Cowie and Rae, of Ellon, Scotland. It is probable that the pearls from this source, land. It is probable that the pearls from this source, collected by the ancient Britans, may have given rise to the interment by Tacitus in his 'Life of Agricola, 'of pearls 'mot very orient, but pole and wan,' being among the indugenous products of Great Hiriata. Pearls, similar to those from the Unio margarityfera, are exhibited under No. 41, p. 1352, Sweden and Norway, by Torstruer, from Christians.

MOTHER-OF-PEABL, OR NACEE.

In the Indian Collection are shown most of the shells which yield the manufacturer the finest kinds of macre; these are the Melengrina margaritifera, Haliotis gigas, Haliotis iris, and a large species of Turbo, which shells are known in commerce as flat-shells, sur-shells, green sasil-shells, buffako-shells, Bombay shells. The motherof-pearl is the internal or nacreous layer of such shells. Fine specimens of some of these shells, from Singapore

and Manilla, especially the great Metagrino and Halistis, are exhibited by Messrs. FAUNTLEROY, under No. 135, pp. 205, 206; and by Mr. BARER, nuder No. 287, p. 626, Class XXII. in connexion with the manufacture of mother-of-pearl hattons. As no specimens, however, of this raw naterial exhibit inproved qualities as the result of human skill or ingenuty, the Jury limit them-selves to the Homourshle Mention of the Isrgest and most instructive collection-which will be found in the Indian Department,

CAMEO-SHELLS AND CORALS.

Specimens of cameo-shells (Cassis rufa), species of Cypraca, and of shells used as ornaments by certain natives of India, with the rude but efficient instruments for cutting them, are shown in the Indian Collection Shells adapted for cameo-cutting are dense, thick, and

consist of three layers of differently-coloured shell material. In the Custis rufa each layer is composed of many very thin plates—in other words, is "laminated"
—the lamina being perpendicular to the plane of the main layer: each lamina consists of a series of elongated prismatie cells, adherent by their long sides. The laprismate cells, adherent by their long sides. The is-mine of the onter and inner layers are parallel to the Bres of growth, while those of the middle layer are at right angles to them. In the cowrise (\$\frac{V}{yprou}\$) there is an additional layer, which is a duplicature of the ascross-layer formed when the suimal has attained its full growth. One of the finest examples of the red coral (Corallism One of the Buest examples of the red corn (Covallian radown) is exhibited by Messrs. ParaAyou's and Casella, under No. 84, p. 683, Class XXXIII., in connexion with cameowork and caving in coral. The Jury desire to award to these exhibitors Honourable Mention for the

ranch of natural rough coral above referred to. The Jury desire, also, to make Hononrable Mention of the coral exhibited under No. 1, p. 949, MATTLAND MINEA, from the Cape of Good Ilope; and of the specimens of coral shown by Messrs. REFFAELIA and Son, under No. 69, p. 1297, Tuscany. Specimens of red corni are exhibited in the collection from Algiers. A fine collection of both corals and madrepores, including the black flexible coral (Gorgowia) is shown by R. TUCKER and Co. (Bermuda), for which the Jury award Honourable Mention.

Specimens of cameo-shells, of shells used as ornament by certain natives of India, with the rude but efficient instruments for cutting the shells, and several kinds of eoral and madrepore, are shown in the Indian collection.

Of the numerous varieties of the common flexible sponge (Spongia officiaolis), shown in different departsponge (Spongar operators), shown in unevert separation ments of the Great Exhibition, the Jury select first, for Honourable Mention, the specimens exhibited in Tunis, by SOLYMAN ESSADDY, under the Nos, 73, 74, and 75, p. 1415. They likewise desire to distinguish, in the p. 1415. They likewise desire to distinguish, in the same manner, the samples of sponges shown by B. PAY-LIDES, No. 12, p. 1402, Greece, from the Gulf of Namplis; the sponges shown by MM. THERE-WITTMEAKERS and PUPSEUPLA, Saxony, No. 4, p. 1104; and those shown by F. Winkley, Primsa, No. 31, p. 1649.

SPONGIO-PILINE.

The substance so called, of which the patent 'epithemas' for medical, surgical, and veterinary parports are fabricated, in exhibited under a great variety of ingenious and uneful forms, especially for applying heatef fluids to the ledy in them of positives and formentations; fluids to the ledy in them of positives and formentations; manufacturer, and exhibitor, M. Mankestek (114, pp. 203, 204), the Prize Medial.

GOLDBEATERS' SKIN.

This substance is the peritorical or secons membrane separated from the intestinal tube of the ox, and semitimes of other animals; it is attenuated by being bears with a hanner, and subsequently prepared so no to revise purtrefiction. The Jury desire tu make Honorardial Medical of the instructive series of this material in Rection of the instructive series of this material Rection of the instructive series of this material Pereparate: Pereparate; and also in No. 104, p. 620, Class XXIII, by E. S. Markhaul,

C.-- AS AGENTS IN THE MANUFACTURE OF VARIOUS ARTICLES.

GELATINES AND ISINGLASS.

The raw materials chiefly used in manufactures derived from the gelatinous texture of animal bodies, may be divided, as regards their commorrial value and appli-

divides, as regards over townserver.

104. The gelatines and plues, properly to called, de-rived from the dissolution of certain animal tissoes, and especially from the water residue of parts of animal manager of the fiber of the property is placed to the property of the property is placed to the property of the property is placed to the property is property in the property is placed to the proper

2nd. The cleansed and dried membranes of different species of fish, more especially of the sturgeon family (Acipsasside's, preserving a peculiar texture, on which their value in the refining of fermenting liquors more especially depends; such membranes are called 'initialisms.'

GELATINES AND GLUES.

The most remarkable progress in the extraction and preparation of pelatities and quies, from the waster remanties of hijkes and kins, bones, tendons, ligaments, and other gelatinosa sissues, has been made in France, in which the country the well-arranged and systematic establishments of for the shanghering of the cuttle, sheep, and horses in the large towns, give great facilities for the economical application of all the parts of animal boties.

Errore

L. F. GRENET (247, p. 1188).—Among the most beautiful productions of this bodustry in Pruces are the specimens exhibited under the above number, which have been specially noticed in the Section of the Report on the awards of the Council Medal:—that distinction having been recommended by the Jury to their ingenious invector.

Many manufacturers in France bave risen to great eminence in this line by fullowing the processes of M. GRENET.

II. CAPTELLE, of Paris, eshibits (107, p. 1156) a still mure varied sostroment of the modifications of gelatine, among which are particularly deserving of notice the very large sheets of transparent gelatine, colourless, white, of various well-defined colours, and embossed or white, of various well-defined colours, and embossed or the colour of the colour of the colour of the colour to the variety and perfection of these modifications of gelatine, the Jury award to M. CAPTELLE the Prize Medal.

Medal.

D'ENTERT BROTHERS (496, p. 1201); V. PITOCK (960, p. 1225); N. Let CLERCQ (1392, p. 1239); J. C. A. ROYER (1461, p. 1245); HERNE BROTHERS (1624, p. 1275); BOGASSE, LEBER, and Co. (774, p. 1217), have exbibited beautiful collections of glues and gelatines similar to the foregoing, and applicable to all the pur-

poses for which a pare, colourless, incolorous gelatine is adapted. Mn. Cottoxer and Sox, of Lyons, fishicate, from bones and various other animal remains, considerable quantities of glues a old gelatines, good specimeos of which are exhibited, together with other chemical products of animal bodies, in No. 1132, p. 1233. The Jury regard the above-named exhibitors of gelatines and glues as worthy of Homorable Mention.

MM. REISS DE DERCEE, of Meurthe (355, p. 1194), and M. FAUSSINGAGNE, of Lyons (1599, p. 1253), merit notice for their excellent gelatines from bones and isinglass for the purpose of dressing various stuffs and

The Cowaste or Bornetizen (Bas-Bhib) (376, pp. 1955, exhibit pectative in small plates, much extended for various preparations or dressings; it is extracted from the boose from which the same Company obtains phosphorus and phosphates of line. This Company—MM. CO. (127p. 1839)—who exhibit excellent speciment of glass—are severally, in the opinion of the Jury, deserting off Boonable Mention.

England.

The greater part of the gelatinous products exhibited by the English manufacturers is prepared from singless, and chiefly applied to articles of food. The commercial qualities of isingless are instructively shown in the collection exhibited under Nos. 117, 118, and 144, p. 204. Some exhibitors, however, show excellent glues and geluites, obtained from urious residues of animal bodies,

and destined for manufacturing purposes.

Mr. NULLIAC (125.), p. 2047, has exhibited a fine assortment of glues and gelatines, analogous to the products of M. Greest; but a part of his fine gelatine in threads, for confectionery purposes, appears to have been obtained from insignals. This is deserving of Honourable Men-

tion.

The systems (1985, 2007), above a boundful sample of mather-coloured introduced of mather coloured of

Canada. Mr. A. MacFarlane (124, p. 966) exhibits good specimens of glue of the deep brown semi-transparent kind, adapted for cabinet-work, and deserving Honourable

ndapted for cabinet-work, and deserving Honourable Meution.

Zollverein.

Three manufacturers here exhibit specimens of the

reme manufactures nere Examin specimens of the present elass of raw materials. One of these, J. G. Loosex, of Cologne (335, p. 1070), shows a fine specimen of an estermed and long-known article called "Cologne glae" (Colle de Cologne), which was the best kind of glue prior to the recent advance to the manufacture of the manufacture of

* This exhibitor was awarded a Prize Medal in Class til

ture of gelatine, and which is still highly esteemed by the joiner and eabiset-maker. The Jury decm it de-serving of Honourable Mentins.

M. A. FEIGENSPAN, of Mühlhansen, Saxony (688, p. 1088), exhibits specimens of gelatines of the Dutch and

Givet kinds, of the ordinary qualities.

The samples from Begian—H. Bitter, of Liege (93, p. 1154), and H. G. Harsotte Dellove, of Liege (94, p. 1154), consist of glues in thick, reddish, transparent plates, presenting the characters of good "Givet glue," and deserving Hononrable Mention

From Portugal have been seut (No. 627) specimens of glues of an inferior quality and putrescent odonr. specimens (Nos, 625 and 626) present qualities of the best productions of a gelatinous nature; but the deno-mination of 'grenetine' under which they are exposed, indicates their French origin.

The specimens (No. 7) from Sardinia of glue, in thin

plates, betray an inferior quality and putrescent odour.

ISINGLASS,

This raw material owes the greater part of its com-mercial value to its special organization, which permits its separation into extremely delicate fibres, capable of operating, mechanically, in the clarification of white wines and malt liquors. In order to obtain the best isinglass, care must be taken to choose the most suitable membranes of the proper species of 5th, and to avoid altering their peculiar tissue in the process of drying and preparing them.

Russia. Under these two relations the products of Russia hold

their first rank, MARIMANOFF and ARMAROONA (81, p. 1369), display specimens of the best quality of isinglass, consisting of the tissues of the air-bladdees of the storgeon (Acipenser

Han), well elemed, and removed and dried without the texture being affected. The Jury select this exhibitor as deserving Honourable Mention. No. 116 presents a variety of isinglass obtained from No. 110 presents a variety of isingiass obtained from the intestinal membranes in the form of alongated stripes, made into bundles. This substance, like the gelatines from the tendrus, bones, and bides of cattle, serves well for different culinary purposes, and for the same uses in manufactures as fine gelatine from other sources.

India. Among the specimens from India there are different kinds of isinglass in the raw state, from species of fishes distinct from those of Europe which commonly afford distinct from times of Europe which commonly anomality in this substance. The principal of these are from a siluroid fish, the Polyaemes pictorius, the dried air-bladders of which are exhibited by Dr. M'CLELLAND (p. 891). (A Prize Medal has been given to this exhibitor in Class III.) They possess the fine fibrous tunic which imparts the clarifying qualities that render isinglass so valuable in the manufactore of white wines and beers; and they are also well adapted for the fabrication of fine gelatines used in

manufactures and confectionery, In the same Collection from India are examples of dried sharks' fins, such as are prepared for culinary purposes for the Chinese market; but this raw material doubtless applicable to the preparation of gelatine for economical and judastrial purposes,

ALBUMEN.

Some excellent examples of this substance obtained from eggs, dried and manufactured, are exhibited in France (1538, p. 1250), by M. H. ALLEON, of Annonay, Ardoche, of whom the Jury desire to make Honourable Mention

ANIMAL CHARCOAL, BONE BLACK, IVORY BLACK, The Jury have examined and compared many specitoens of these substances, cxhibited by different nations, and propose to distinguish, by a Prize Medal, the charcoal, exhibited by J. H. M. VIOLETTE, France, (1528, p. , and by Hononrable Mention the following :-

1230°, and by romontane arctiton the following. —

MM. KULLMANN BROTHERS (555, p. 1205), for the speeimens of granulated and polyorised animal charcoal,
included in their instructivo samples of different chemical products,

L. RAUCHER, Jun. (1422, p. 1244), for his samples of animal charcoal

M. Tordeux (699, p. 1212), for his examples of boneblack, granulated, pulverised, and of various qualities. Portwoal.

J. F. Pinto Basto (629, p. 1314), for his specimens of animal charcoal, in powder. Netherlande

P. SEITS (20, p. 1143), for his specimen of animal charcoal.

Zellverein J. WARCHTER (434, p. 1075), for his granulated and powdered animal charcoal, obtained from the seum of sugar in the process of refining.

Mecklesburgh-Schwerin. M. MEYER (6, p. 1134), for his samples of charcoal.

Belgium. B. Segurna (110, p. 1154), for his animal-black, bone-

black, and ivory-black.
E. Verstrakten (108, p. 1154), for his specimens of animal-black. Exglord,

D. CHAN (65, p. 541, Class XVII,), for his bone-black and ivory-black,

D. FOR PIGMENTS AND DYES.

COCHINEAL AND CARMINE. The beautiful red dve called 'cochineal' is obtained from the dried body of an insect (Cocus carti), which feeds chiefly on the Cocus corcivelifer and the Cutus Opanito. The female insects, which are wingless, are alone collected, and the different degrees of value attached to them depend chiefly on the different methods employed to kill and dry the insects. Analyses of the cochineal have yielded chitine, farty matter, phosphates of lime and potash, chloride of potassium and carbonate of lime, and the colouring matter to which the name of 'carmi-nium' or carmine is given. The chief use of cochineal is the dyeing of scarlet: the fine colour which it yields is converted to that tint by means of eliloride of tin, called by the dyer 'tin spirits.

The following are the specimens of eochineal which, in the opinion of the Jury, demand Special and Honourable Mention. England

JEWESBURY and Co. (66, p. 200°).—Varieties of cochineal from Honduras, Mexico, Teneriffe, Java, and the West Indies.

I. SAOLER (76A, p. 200*). Spain.

D. J. B. Benenoues (192a, p. 1341). D. M. Gonez Alcaide (151, p. 1338).

D. E. MERON (150, p. 1338). The culture of cochineal, in Spain, has extended itself of late years along the sandy and barren coasts of the Mediterraneau, and with good success.

Another red dyeing substance, called Grana kernes, is obtained in some abundance from the shrubs of the province of Huelva, which is sold at Valencia at eight reals per 1b. The GOVERNOR of the PROVINCE of HUELVA (937, p. 1334), has transmitted a specimen of this kernics, of which the Jury desire to make Honourable Mention.

Algeria. M. Hasov (28, p. 1261).—The Jury award Hononrable Mention to this exhibitor for his very promising specimens of cochineal from that young colony.

Finally, amongst the animal raw products the Jury desire to select for Honnurable Mention the specimens of guano from the Cape of Good Hope, exhibited under No. 37, p. 950, by J. Seastuure; No. 50, p. 952, by A. De Pass, and that from Van Diemen's Land, No. 255, p. 997, by J. MILLIGAN.

EDWARD COWPER, Professor of Manufacturing Art and Machinery, King's College, London. W. H. HATCHER, 22 Hawley Road, Camden Town : Engineer.

THE machines on which the Jury of Class V. has had to adjudicate are generally of the class called "Prime Movers," being those more directly connected with the development of power than with its application. Where, how ever, the application of the power to the result to be accomplished is direct and immediate, the mechanical expedients by which it is made were also assigned to the consideration of this Jury. Where the application is indirect, being made through a series of mechanical elements intervening between the prime mover and the point where the result is accomplished, such intervening machinery was reserved for the consideration of the Jury of Class VI.

It is obvious that in the consideration of this class of machines, the Jury must be chiefly guided by the principles of mechanics as distinguished from those of mechanism. The machines referred to the Jury were divided by the Commissioners into six classes, as Collows :-

V. Machines for direct use, including Carriages, and Railway and Naval Mechanism,

A. STEAM ENGINES AND BOILERS, WATER AND WIND-MILLS, AND VARIOUS OTHER PRIME MOVERS.

1. Boilers 2. Land Engines. 3. Marino Engines. 4. Wind-milis.

- The total number of these objects exhibited was 537, distributed through the seven subdivisions as follows :-

NUMBERS of Objects in the Subdivisions of Class V. D. Ε. F. g.

The following are the proportions in which they were contributed by different countries:-

112 40

Austria.	Belgiam.	Chios.	Denmark.	Egypt.	England and the Colonies.	France.	Netherlanda.	Portugal	Sardinis-	Tarkey.	Tossay.	United States.	Zoliwecin.
5	21	2	ı	2	424	63	6	1	1	1	1	16	4

- The Jury beld its first meeting on the 12th May, when it formed itself into three Sab-Juries, which respectively undertook to examine and report upon the objects included under the several subdivisions,
- The number of objects referred to the first Sab-Jary (A, B) was 184, to the second (C, D), 128, and to the third (E, F, G), 224. The reports of the Sah-Juries were made to the whole
- Jury, which met twice a-week for that purpose, and the Jury visited and examined collectively all those objects which were considered by the Sab-Juries to claim such further examination, including all those recommended for prizes, Its awards were made on that examination, No other objects were examined by the Jury, in the
- English Department, than those placed by the Royal Com-nissioners in Class V. of the Catalogue, except such as were referred to them from other Juries. In the several foreign departments the objects were not classed in the Catalogue. The Jury had, therefore, to select those objects in these foreign departments which, in accordance with the instructions of the Commissioners, appeared to belong to their adjudicatio
- The number of meetings of the Jury was 18: they were all attended by Colonel Linyd, special Commissioner,
- and minutes were kept of their proceedings by that gentleman and by the Secretary.

 The Sub-Juries assembled, with few exceptions, daily, until their work was completed. The final awards were made on the 20th of June; they
- were confirmed by the Group B, of which the Jury formed part, on the 30th of June, and by the Council of Chairmen in the 14th July,

 The following table contains a general statement of the numbers of these awards in the several countries which have contributed to the Exhibition, together with the
- numbers of Exhibitors, and exhibits in each country, and the proportions which these bear to the Medals awarded. As, for ohvious reasons, the machines, so difficult of transport as those of Class V., sent from foreign countries, could not be expected adequately to represent the mechanical capabilities of those countries in respect to such
- machines, so the Jury are of opinion that the machines referred to their examination from Great Britain, however numerous and in many respects remarkable, do not, in the aggregate, for reasons which it is unnecessary to specify, duly represent the engineering resources and skill of Great Britain, and that any future exhibition would afford conclusive evidence of this fact.

cerved from home consideration of the Reporter of the Juny has to add his own, to Mr. Haven Marcutar, Mr. Havensa, and Mr. Maarva, who acted severally as the Secretaries of the three Sub-Junies, for the assistance given to him in the compilation of this Report, the decails of which, whether continued in the tables pre-to-white prizes have been awarded in each section, have been collected chiefly by them.

In reporting on the inbours of the Jury, it will be convenient to take the objects referred to its consideration, according to the subdivision of the Commissioners. SECTION (A),

The following table (see pp. 170, 171) contains a classification of the objects exhibited under this subdivision, with the number under each class exhibited from each country.

Invention with regard to the steam-engine appears from this table to be specially directed to the economy of

The tubular boiler is a contrivance for that end, offering, within the same bulk, a greater surface to the action of the heat on the one side, and of the water on the nther, than any other form of boiler. There are eight such, ar models of them, in the Exhibitium, intended far the land

cognic.

In marine engines this economy of space has a special value and importance. The direction which invention is taking with a view to this economy is shown in numerous expedients for the direct action of the juston rod upon the crask of the public-wheel or of the screw propeller, without the intervention of the beam. There are no less than thirty-first direct-acting engines or models ex-

A rotary steam-eagine, if one could be contrived whose rabbing surfaces were steam-right and durable, would effect a remarkable economy of space, and would be better calculated than any other thirties in serve propeller. The increased importance than given by the unoff the screw propeller to the invention of rotary engines is indicated by the exhibition of nine such engines or models.

If, among these, none appears to afford a complete solution of the problem, at any rate there is nothing to discourage further attempts. Nor is this problem the less likely to be tolved now that a gara of power is nu longer looked for from the use of rotary engines, but nuly a simpler and more convenient mode of applying

Such a gain might indeed result from a free access of the atoms to the pixton from a dismission of the friction or the jar of the variety parts or from a more complete or the pixton from a dismission of the pixton from the information in mechanics, perceital men now know, that there is no more possibility of thereading the work of an any of its working parts, than there is no increasing the quantity of water which a reservoir will supply, by vary— The difficulty of susping the best form to a solid body

The difficulty of assigning the best form to a solid hody which is to receive and apply the resistance of a fluid, is indicated by twelve competing forms of paddle-wheels and fifteen different series propellers. CLASSIFICATION of STEAM ENGINES and BOILERS, showing the Number of each Class exhibited from each Country.

AWARDS IN SECTION A.

No. 8, p. 211, and Illustration, 212. Joun PENN and Sox, Greenwich. 1. A pair of 12-hore power oscilland cylinder direct-acting engines, for river navigation, of light construction and good workmanship for small vessels. 2. A pair of 30-horse power patent direct-acting engines, called trank engines, for driving a screen propeller.

In these regions, which are nimber to these of H. M. Collins and the collins of the collins without the above regime of the trents, it includes in dameter, projecting through both code of the collins o

The ordinary making of a suffing-hox at one end is, moreover, in this regine, enlarged into that of the large convex surface of the trunk (14 inches in diameter) at both ends; and the difficulty of keeping the packing of these steam-tight, is increased by the lateral strain, to which, serving as guides, they are subjected.

wairen, serving as guides, trey are suspected.

These are practical disadvantages which may, for nautical purposes, be compensated by the economy of apace which is effected in this engine. It is from this consideration that the Jury has included it, with the river engine, in the award which it recommends of a

Conneil Medal to the makers.

No. 119, p. 1155 (Belgium).

Liege. 1. A pair of 140-horse power vibrating eviluder engines, for the navigation of the Rhine. The framing and paddle-centries, usually of cast-iron, being in these engines made of wronght-iron, the requisite strength is obtained with less weight.

The vibration exhibits twing so placed on opposite sides of the crash that each piston completes its stroke in an inclined position of its eyilinder (and, of course, when the stroke of the other piston is incomplete), the same crank-pin is made to serve for both pistons, and a single crank supplies the glace of the two striple angles to come and supplies the glace of the two striple angles to concurrently and any of the complete committee engine, of good construction and worknamabily; with a small dender-copies attached, for keeping up a constant apply of water to the holder when the engine is attainmary.

3. An oscillating direct-acting three-horse power portable engine and boiler, so combined that the weight of the boiler gives stability to the working parts of the engine fixed to the side of it. The arrangement is simple; the inside of the boiler may be easily cleaned, and the working parts reached.

4. A small doukey-engine, with its pumps and valve-boxes complete, for a scann-boxt; to apply usefully the steam which would otherwise he blown off through the waste-steam pipe, in filling tha boilers, pumping the waster from the bige or from the sea to wash the decks or sails, &c.; and in case of need, to extinguish fire, A Council Modal is recommended for this collection of

No. 647, p. 247. THE DESIGNATION CONTANT, New-castle-upon-Tyne. 1. Rolled irou plates from 17 to 20 feet long for ship-building paroses and for the sway beams of engines. 2. Rolled keel iron, a milway bar, measuring of feet 3 inches in length. A great importance has of late years been given to the manufacture of wrought iron in large masses by the increased scale, which every form of construction of iron is assuming. The limited dimensions of the wrought-iron plates, sway-beams, shafts, burs, &c., with which the engineer has to work, are indeed among the chief obstacles to construction in iron. Although much progress has of late years been made in the scale ou which it is wrought, yet these are believed to be among the largest specimens ever produced in their respective departments of manufacture, and the Jury were manimous in their recommendation of a Council Medal to the mokers of them. They regret that this recommendation, not having been adopted by the Council of Chairmen, they have only the Prize Medal to award to

No. 543, pp. 241, 242, PATENT SHAFT and AXLETBEE COMPANY, Brunswick Iron Wurks, Wedneslury. 1. Speeimens of iron of their manufacture. 2. Patent milway carriage axles and other axles, with illustrations of their process of manufacture. 3. Patent links for suspension

bridges, rolled at a single beat. To form these axles, plates of iron are placed together like the radii of a circle, and tied with pieces of wire. In this state they are heated to a welding heat and then placed under forge-hammers, which have, together with placed under forge-hammers, which have, together with their anxiis, circular eavities of the dimensions of the axle to be formed. The fibrous quality of the iron derived from the plates, which are welded together to form it, thus remains unimpaired in the forging. A Prize Medul has been awarded for these articles.

No. 641, p. 247. COALBROOK DALE COMPANY, Stafford-

collection of exhibits a Prize Medal is awarded. (Conneil

AWARDS IN SECTION C.

No. 300, p. 226. Laoyp, G., 70 Great Guildford Street, Southwark, Inventor and Manufacturer of the patent centrifugal disc blowing machine, is awarded a Prize Medal.

The vanes of the blower are curved, and the sides conical. The air enters into a space left for its admission about the axis, and is expelled when the vanes are put rapidly in motion at its periphery, into a ease which surrounds it, from which it is conducted by a pipe, and the blast applied by a nozzle. The exhauster differs from in not having an outside case. The air is conducted by a pipe from the space to be exhausted to the central part of the exhauster, and expelled at its periphery. The improvement claimed is in the curving peripbery. of the vanes and in the coaical form of the sides. The action is stated to be noiseless, and the power consumed, less than that in the ordinary blower

The Jury, being desirons of verifying these statements directed a series of experiments to be made, of which the results are detailed in the following table (see p. 176). The blower being driven by Messrs. Clayton and Shuttleworth's steam engine, through a band which was passed over the dram of M. Morin's dynanometer, the work expended in driving it was registered by that instrument, with whatever velocity it was driven. The number of revolutions made per minute was measured by a counter, and the blast being received into a closed reservoir, was allowed to escape from it by a rectangular pipe, whose aperture could be varied by a slide. The pressure of the air in the reservoir was measured outside, by means of a bent glass tube communicating with the interior, and containing water.

The pressure of the air in the reservoir being known and the dimensions of the aperture by which it escaped, the velocity and density of the blast could be calculated,* Hence its ris rips was known, half of which represents the work which the blast was capable of doing if all its power could have been applied. The apparatus was constructed under the direction of Mr. Hensman, and the experiments were made and the table calculated by Mr. Hatcher (see page 176).

The blower of Mr. Lloyd was found to work com tively without noise. It is due to him to state that the apparatus at the command of the Jury did not enable em to drive the fan with that velocity which he allowed to be necessary for obtaining the greatest useful effect.

No. 120, p. 1155 (Belgium). The Marcinelle and
Coullet Syllting Contant. A ventilator for airing A ventilator for airing mines. A. Fabry, inventor. This machine consists of two wheels, baving parallel axes, each earrying three vanes

of a peculiar form, and made to revolve in opposite directions. These vanes engage and disengage with one another like toothed wheels; and as they separate, ereate, by their peculiar epicyclical forms, a vacuum about the axes of the wheels, discharging the air into a surrounding case, by their peripheries. The wheels do not drive one another by their peripheries. The wheels do not drive one another by the contact of their vanes, but by an independent mechanical consexion of their axes,

An economy of power is claimed in the use of this machine, as compared with the ordinary means of ventilation in mines. It has been introduced within the last few years in various mines in Belgium, particularly in those near Charleroi. The Jury bave awarded a Prize Medal to the exhibitor.

* A resum of the theory of this subject, and of other practical questions to which the attention of scientific men has of late years been directed, will be found in the useful work entitled "Atie Memoire des Ingénieurs, par G. T. Richard. Paris, 1818."

No. 839, p. 1290 (France). Extra, E. —, 53, Rue de Malte, Paris. Various Blowing machines. M. Endrés blowing machine is an improvement on the ordinary blokemidt's bellows, giving in it a more netarly labat. It is composed of two nit-resolt, commanicating by two plyes, in once of which a cylindrical believe is worked, plyes, in once of which a cylindrical believe is worked, not not support to the contract of the second arizes of the second arize-resol or reservoir is regulated, and the bellows is made to drive air into it, both when it ascenda and descends. A Price Media is warded.

In reporting upon the hybrinesis machines exhibited, it is impossible to refrish from solvering to the general impossible to refrish from shortest to the general ledge on which the perfection of ruch machines always being the contract of the contract of

• This is the care with the horizontal water-wheel; without the various scientific expedients adopted in the construction and working of that wheel, as the turbine, it could not probably in any case be employed with advantage.

† It is but reasonable to expect that the superierity which the French have confersedly attained in certain.

which the French have economically attained in certain branches officiality, by onlivating the arts of design, will eventually appear—through the agency of the Ecoles de-Arts et Mediers—in the scientific character of their machines.

The whole establishment of a water-wheel partakes of

The whole establishment of a water-wheel partakes of this ebaracter tha form and dimensions, for instrace, of the shulce and coursers—the number, dimensions, and forms of the float-boards—the dimensions of the wheel listef and the rate of working. It has been abundantly shown, by experiment, that by varying these conditions, the work of the same fall may be varied by from one-half to two-thirds of its whole amount.

now almost universal in France, of the curved floatlocards of M. Poncelet in undershot and breast-wheels, and of the turbine of M. Fourneyron. It is not, however, only in the adoption of new forms of water-wheels in France, that the improvement has been apparent, but in the better establishment and more skilful werking of the old forms; such as are in use in this country.

Of all such expedients for the recomminal application of unter-power, is a principle that, as for a it may be of unter-power, is a principle that, as for a it may be of unter-power, is a principle that, as the solid lever is without vision, and that it should lever in without vision. For that there is power level by the shock of water for water may be absorbed in the reverence into which it is the properties of a six of water may be absorbed in the reverence into which it is visit as yet of the properties, and it is visit as yet of the power which make an enterprise and the power which man have been expended, in giving it is visit as yet of the power which man have been expended in giving it defines, function and the power which make have been expended to be not added the severe which the power which make the power which was a cloud of the severe, that three should be so made and considered with the power which was an extended to the principle that all expedients are the economical of these principles that all expedients are the economical of the principles in the severe control of the principles in the disk of the principles to find them to be a principle of the principles and the principles as the principles as the control of the principles are the principles as the control of the principles are the principles as the control of the principles are the principles as the principles are the principles as the principles are the principl

The record of this fact is important, as placing in an obvious point of view the necessity of other means than are now afforded for the scientific education of mechanical engineers.

PUNPS.

Not withstanding the great analysis of the pump, and to extensive me, in a use of our work madden, conceptually a second service of the pump, and the pump of the

[CLASS V.

water through the poung. This fact cannot be too distinctly, stated. There are hybratile machines which yield, in the water raised, from 75 to 80 per cent of the poperation, but so imported in instrument in the lift and force-pump, that the best yields only 45 per cent, the screepe set yielding more than 80 per cent, the screepe set yielding more than 80 per cent, 50 hard for 10 per cent, 10

1st. In the small size and the peculiar construction of the valves, 2nd. In the proportion of the section of the barrel to

that of the suction and force pipes.

And, In the form of the suction-pipe at the extremity where the water enters it, and of the force-pipe at the

extremity where the water is discharged.

4th. In the forms of these pipes where they unite with
the barrel.

5th. In the preportion of the length of the barrel to the depth from which the water is raised. It is impossible to say to what extent the loss of power due to these causes may be removed, without experiments directed expressly to that end; this much is, however, certain, that it would be sensibly diminished by increasi the size of the valves, or by any other expedient which should diminish that sudden variation in the section of the stream which the valves create. That variation, attended as it is by a corresponding sudden variation of the velocity of the stream, involves a loss of power varying as the square of the difference of the two velocities," and dependent, therefore, on the ratios of the sections of the saction-pipe and force-pipe to the section of the harrel. From inattention to this arises the second source of loss of power we have enumerated. It is well known that the form of the mozele by which water is discharged from a force-pump influences largely the amount of the from a force-pump innuences targety the amount of the discharge, but it is not equally well known that the form of the extremity of the suction-pipe by which the water enters has an equal effect in facilitating its ingress.

At its increased by half the vis vive due to the difference of the controller. The regulation of all theories of Caroni, and the viscoliver. The regulation of the Money of Caroni, and the viscoliver of Caroni, and the viscoliver of the Caroni and the preparation of the policy of the Caroni and the Caro

pump by effinx from the spont, or by the raising of the valve in the bucket), more water is brought into the barrel than is due to the volume generated by the piston. Half the vis viva of the water under the piston at the end of the stroke measures this surplus work. If a sufficient pause be allowed, and if the head of water above the piston be not considerable, as in the common sectionump, the upward rush of the water beneath it at the end of the stroke will lift its valve, and a portion of the surplus work (represented by half the vis viva) will take effect in the elevation of more water into the barrel than effect in the cevation of more water into the barrel timas would fill the space generated by the piston; and timas is explained the fact of the greater discharge from such pumps when worked by quick strokes with intervening panses, than when worked slowly. If the head of water above the piston be, however, considerable, as in the force-pump, any vis viva which may remain in the water at the end of the stroke will produce a shock, and a cor-responding loss of power. This shock, commonly experienced in the action of force-pumps, is accompanied by a violent and prejudicial action of the valves, especially when they are of metal. When the down-stroke of the piston follows so rapidly on the up-stroke as to meet the ascending stream produced by the preceding stroke, the resistance to its descent is increased, as well as the loss of power due to the commotion of the partieles of the fluid it traverses.

It is obvious, therefore, that the proportions of a pump, to be worked by a given movine power, should be such, that the power to be expected at every stoke may just a list instancial in what proportions this work is distributed over the stroke, or under what traying degrees of pressure it is generated, provided that the pressure the piston. If this pressure be exceeded, the piston may separate itself from the water between this time barrel, the pane drawing air; and this is more labyle to over at the the motion of the water at that path being necessarily the motion of the water at that path being necessarily

mountained a finite velocity to the vister at the commonweater of the struck, or with the large described by the pisson is still exceedingly small, requires a most type that the contract of the structure of the

* These proportions are determined without difficulty. † If we conceive the stroke to be completed under a constant pressure, which, with the assistance of the valvereservoir, is possible, the extreme height to which the waterin the barrel will ascend is greater than that at which this pressure would hold it suspended without the elocing of the saction-valve.

amenta Google

space is aided by the pressure of the condensed air in the an-relamber, and when the stroke is completed, the state of condensation of this air is, by the momentum of the condensation of this air is, by the momentum of the through the possess by which that pipe communicates with the air-chamber. Thus, by this contrivance, the surplus work, or half the vis viry, which remains in the water of the saction-pipe at the conclusion of each stroke, the property of the contribution of the contribution of the saction-pipe at the conclusion of each stroke, the pipe to be pipe the wext stroke of the pipton.

The nature of this action will be best understood from that of the hydraulic ram. The contrivance constitutes, indeed, in some respects, a union of the action of the ram with that of the pump; and, besides accomplishing the object for which it was applied, appears to have the effect of considerably economising the power employed in working pumps.

The socition air-chamber has been added to a common metion-point, exhibited by Mr. Sazz (45.2, p. 23.5), in the Agrinus are consistent of the society of the Agrinus are allowed by the society of the society of the society of the class of small pumps, called "free-veripers," exhibited by Mr. Ratomarer (46.9, p. 27), and Mressy, Saxes and by Mr. Ratomarer (46.9, p. 27), and Mressy, Saxes and Canadian engine, it does not, however, appear to have been applied in any of the larger class of engine exhibited, it than have been given to it in either of these engines.

arrangement.

Centrifugal Pumps.

In these pumps, water admitted at the axis of a hollow wheel, traversed by vames and made to revolve rapidly, is expelled at its circumference.

The pipe by which the water reaches the axis of the wheel (or the reservoir which feeds it) becomes, under these circumstances, a saction-pipe, and if the reservoir into which the water is received from the periphety of the wheel be closed, and a pipe be carried from it upwards, the latter becomes a force-sine.

the latter becomes a force-pipe.

The greatest economy of power in such a pump-may
be expected to be attained when there is the least possible loss of the vis viva of the water in its access to the
wheel, and when there remains the least possible vis viva
is it when it leaves it. For if there he my loss of the
vis viva of the water in its ingress to the pump which

A pump on this principle is described in the Traité de Mécaulque of Borgnis, Paris, 1819. The Invention is there ascribed in MM, Designt et Deville, Marbines Hydraullques, p. 32; h is probably, however, more accieus. TABLE of the QUARTITIES OF WATER raised from the same Depth and threwn thrown the case Reservoir in equal times, by the mane Plate Excitate, each worked by an appropriate

might have been avoided, it is evident that power must have been expended unnecessarily in producing that is viva. And in like manner, if any viv viva remain unnecessarily in the water when it beaves the wheel, it is evident that the power by which that via viva was created might have been saved.

The expedients by which the water may be brought to the wheel with the least loss of vis vivu are common to this and to other bydraudic machines; those by which it enters and is delivered from the wheel are peculiar to the centrifugal pump.

If the values be straight, it is crident that whatever nay be the velocity of the water in the direction of a radios, when it leaves the wheel, its velocity in the direction of a traggest will be that of the elementeeree of the wheel, so that the greater the velocity of the wheel, the greater will be the amount of via viva remaining in the water when distanted, and the greater the amount of power nucleosly expended to ereate that vis viva.

If, however, the vane he careed back unde, as regards to melion of the white, as to have now the direction melion of the wheel, so at to have nowly the direction of the melion of the wheel of the varieties raise in the centrifugal flower of the same factor of the varieties of their state of the varieties of varieties. And a varieties of varieties of varieties, and carried the varieties of the varieties of the temposite of direction—in statistics, in that amore degree will the waterly offered of every extra a finished to the varieties of varieties of varieties and supplies of varieties and supplies of varieties and supplies of varieties and supplies of varieties are a supplies of varieties and supplies of varieties and supplies of varieties are a supplies of varieties and var

pedient of curred vanes is adopted in Mr. Agueld's peap,. With regard to the admission of water to the whee, it is obtained to the section of the control of

the channels formed by the vanes; as in the turbine. It is obvious that the tendency of the centrifugal force continually to increase the velocity of the water over the continually to increase the velocity of the water over the velocity of the variety of the value of the velocity of the value of the velocity of the v

This diminution of the sections of the channels might probably best be effected by giving to the sides off the wheel the forms of conical discs; an expedient which is adapted in Mr. Llayd's blowing-machines, and in Mr. Bessence's centrifugal pump,

Finsbury Square, London, for a centrifugal pump, * o.e. foot in diameter, having curved vases, separated by a central disphagu, perpendieniar to the axis and intersecting the vanes, so as to form a double wheel; to the two parts of which access is given for the water by central spertures six inches in diameter, on opposite sides of the wheel, whose says is fixed to the dimburance.

To determine, the useful effect of this pump, n series of experiments were made under the direction of Colonel Morin, the Vice-Chairman of the Jary. The results of these experiments are detailed in the following Table. (See page 182.)

The work of the motive power was determined by the well-known dynamometer, constructed by M. Morin, on a principle proposed by General Poncelet. It is the distructive feature of this dynamometer that it registers each effort of the motive power with the space through which the machine is driven by that effurt, however

The contribugal-ramp is by so means are investigablement extends in further perticular of its history, which is the property of the property of the consolitant to state that it was used in America as for lack and the property of the contribution of the coningent contribution of the designation is now of the American panels. The explanation has been considered due to grain out. The explanation has been considered due to priority, either in the invention of the machine or in the material and the consideration of the contribution of the same threatening of the contribution of the fitness of the contribution of th

A mode boff one of them was calabilitied to be leave, by M. Geyan, but glade from the calabilities are in the late properties of the increase of The findiant, passage, in them the properties of the increase of the increase of the calabilities of the calabilities of the calabilities are sorted as extending the calabilities of variable it may be; and that it does this, not for a single stroke of the engine, or revolution of the wheel by which the machine is driven, but continuously, for a lengthened period. The dynamometer was applied to a drum, a period. The dynamometer was appreed to a urain, a strap from which drove the pump. To ascertain the work yielded by the pump, the water, raised by it from a reservoir beneath the floor on which it stood, to a given height above it, was received into a reservoir on the floor, wherein was an aperture of a rectangular form through which it could flow back into the reservoir, and which could be opened or closed to any extent by a slide. When the pump was set to work, the dimensions of the apertore were so adjusted by means of the slide, that the water renrained stendily at the same height in the reservoir. The

quantity of water which escaped by the apertore was then obviously the same with that raised by the pump. The dimensions of the aperture and the slepth of the water being known, the quantity of water which escaped could be enjeulated, and thus the water raised by the pump was

To ascertain the influence of the enryed form of the vanes on the efficiency of the pump, straight vanes were applied to a wheel of the same size, worked under the mpyrous or a viner of the same size, worked finder the same circumstances. The results are stated in the Table. The pumps of Mr. Gwynne (140, p. 1441) and Mr. Bisschen (421, p. 232), on which similar experiments were made, the particulars of which are detailed in the

No. 414, pp. 233, 234. MYNCHOL and VERNON, Liverpool. Working model of a patent steam-travelling e-ane, for lifting and removing beavy weights to italker-yards,

goods' depies on railways, &c.
Like the ordinary hand-travelling erane, this machine
moves upon a trans-road hild upon longitudical becume,
raixed from 15 to 20 feet above the ground. A square
shaft runs the entire length of this road, and is connected
at one extremity with the engine, which cases it to
revolve. This shaft is supported by brackets, which
wing on centres; so that each may be readily displaced

by pressure applied in the direction of the length of the shaft. Motion is communicated from this shaft to the machinery of the crase by means of a drum, which slides upon it—carried along by the crane—and which displaces each bracket as it passes it.

No. 76, p. 1146. (Netherlands). K. ENTHOVEN, the Hagne, Inventor and Manufacturer. An iron crane for weighing affil lifting, constructed on an ingeuious principle, and of good proportions and workmanship.

weighing aft lifting, constructed on an ingenium practice, and of good propertions and was almost a state of the state of

the security of a grap upon a classic. P. Matta. Under No. 16(1), p. 90. (Travel). Model appearing for the extraction of one, and for the few and safe ingrees and the period of the control of the control of the control for period or the control of the control of the control for period or the control of the control of the control of the tree and the military, and work the pumps. A four-sheld not received the military and work the pumps. A four-sheld not of the shaft, serves as a golde to a serve of square caper, which are lifted through one stage of the frame by each which are lifted through one stage of the frame by each versie of maps, which, while place of a service of maps, which, while the control of the control of the control of versient of maps, which, while on a service, are precedted by the position by their weight. A militar expedient which position by their weight. A militar expedient as it rices, and relaxes it as it decender. The eage are and by an implantous construence to under these states of the control of t

Honourable Mention is made of Mr. DANIEL GREA-TOREX (415, p. 230), 9 Deslorough Terrace, Harrow Road, Paddington, for his model of an improved hosting machine for raising and lowering goods, which can be worked by hand or by steam. The person accending or descending with the machine can stop it at any point of the secent or descent.

Jacus.

No. 509, p. 237. The Jury award a Prize Medal to George England and Co., Idatcham from Works, New Cross, for their traversing serew-jack, seeful for railway purposes, and commended for ingenuity of contrivance, and economy of material and space.

No. 490, pp. 236, 237 (Illostration, 237). Also to S. Thonstos and Soss, Birmingham, for their hydraulic lifting-jack, constructed on the principle of the hydraulic

VALVES.

No. 201, pp. 225, 226. A Prize Medal is awarded for R. Howstoo's triple-best valve for large pumps, which affurds three passages for the water. They are anumbrand concentries, and, by an adjustment of the weight of the load on each to the surface it offers to the pressure of the water, are made to open and close is necessive, thereby diminishing the first effort of the lift of the pission (due to the incretion of the water) and the blow on its descent.

Corre

Hononrable Mention is made of the following:—
No. 476, p. 295. Major Romart Little, Woolwich
Common, Inventor, for an improved water-ceck for connecting pipes without breaking joints. The plug of this
cock may be removed to be reground, without unsol-

dering the pipes.

No. 1608, p. 1254 (France). — Fainault, Brassfounder, Orleans. Hermetic tap. A cook elosed or opened
by means of a coarse serew acting upon a valve. A good
and simple contrivance, not likely to get out of order.

The introduction of curves in milways, unless their radii be very great, has hitherto been considered unafie, and the not of the construction of milways is, under an extension of the control of the milways is, under control of the
Our colleague, M. Anvoux, who, as a member of the Sub-Jury A., on Carriages, was placed out of the number of competitors for medals, has attempted the solution of this problem on the railway from Paris to Scenux, and a working model of one of his trains is excludited in the French Department. On this railway there is a zigzay, he radii of whose earners vary from 185 to 200 feet, the radii of whose earners vary from 185 to 200 feet,

As the labours of the Sub-Jury for carriages were conducted independently of the principal Jury, the exclusion

which is said to have been traversed without necident by the trains of M. Arnoux daily, at a speed of from sixteen to eighteen miles an hour, since the month of June 1846.

1846. which recent experiments on a large scale have created, The construction of railway carriages admits of great improvement, a fact to which the attention of inventors is obviously directed. In the construction of railway waggons, the use of corrugated iron has been introduced;

and cast steel for the construction of railway springs appears to be coming into more extended use. beautiful specimens of this manufacture from the Continent, as well as from Great Britain, have been exhi-To maintain a great speed, the first requisite in a loco-

motive engine is great evaporating power, and to obtain this there must be a large surface of metal exposed to the action of the heat on the one side, and of the water on the other. This is obtained by Mr. Stephenson's admirable expellent of a series of tabes which traverse the boiler, conveying the heated air from the furnace to the chimacy; by which expedient the absorption of the heat from the air, heated by the fire, into the water, is made to extend over a greater surface than by any other.

AWARDS IN SECTION E.

No. 512, p. 238. See Illustrations, p. 234. In the engine called the "Liverpool," patented by Mr. T. R. Champton, to which the Jury recommends the award of the Council Medal, a heated surface of no less than 2,136 square feet is obtained by means of the tubes, besides the surface exposed to the direct action of the heat in the furnace, which measures 154 square feet. The evaporation result ing from this vast amount of heated surface is stated to yield a steam-power equivalent to that of 1,140 horses. It is a second condition of great speed in becommitive engines, that the piston should make the fewest possible number of strokes whilst the engine traverses a given space; for which purpose the driving-wheels must be the largest possible. By bringing these from the position they have been accustomed to occupy (near the middle of the boiler) to the foot-board of the furnace, Mr. Crampton has succeeded in giving to the driving-wheels of his engine, the "Liverpool," a diameter of 8 feet. It is a further advantage in the use of large driving-

wheels, that for a given velocity of the engine, they diminish the angular velocity of the wheel, thus diminishing the tendency of the wheel to jump, by reason of its centrifugal force when the crank is not truly halanced, t a tendency which, before the attention of engineers was called to the necessity of balancing the erank, was fruitful in accidents. The same expedient by which Mr. Cramp ton obtains space for larger driving-wheels, enables him to place the boiler luwer, and thus-giving a lower position to the centre of gravity of his locometive-to increase its stability

The Jury award Prize Medals to the following: No. 509, p. 238. GEORGE ENGLAND and Co., Hatcham Iron Works, New Cross. Improved locomotive engine for railways of light traffic, weighing, with coke and water,

ten tons. The centre of gravity is low, and a good mode of M. Arnoux from competition for the prizes awarded by the Jury of Class V. is made rather according to the letter than the spirit of our instructions.

* A pair of guide-wheels placed at an inclination of 45 degrees to the vertical on the first earriage of the train, as segrees to the vertical on the nest entrange of the train, and a similar pair on the last, compel there to take and to main a similar pair on the last, compel there to take and to the training the control of the c

axle of the next pair of wheels in the same carriage.

† Or from the momentum of the connecting rod, &c., as at every revolution it ascends.

has been adopted of heating the water before it is pumped into the boiler. The driving-wheels of engines so light as this, require to be very truly balanced, or their weight should be very small in comparison with the engine, that they may travel with safety. The award is made for

they may travel with salety. The award is made for ingeninus arrangement and good workmauship. No, 510, p. 237. W. Buidors Anams, I Adnim Street, Adelphi, London. 1. A light locomotive engine coupled to a four-wheeled carriage which supports the end of the engine in case of accident. The engine carries water beneath the floor, and has a sledge break, 2. An eightwheeled double railway-carriage for first and second-einss passengers,

The award is made for combination and arrangement in the locomotive, for the break, which is well executed, and for good proportions and workmanship in the car-

No. 506. The Great Western Railway Company. Loconstive engine and tender, constructed at the Company's Works at Swindon. One of the ordinary class of engines, manufactured by this Company for passenger traffic since 1847. It is eapable of taking a passengertrain, of 120 tons, at an average speed of 60 miles per hour, upon casy gradients. The evaporation of the boiler, when in full work, is equal to 1,000-horse power—the when in init work, is equal to 1,500-noirse power—ties effective power, as measured by a dynamometer, is said to be equal to 7.43-horse power. The weight of the eugine, empty, is 31 tous; coke and water, 4 tous—engine in working order, 35 tous. Tender empty, 9 tous; water, 1,600 gallous, 7 tous 3 ewit; coke, 1 ton 10 ewit; total, 1,600 gallous, 7 tous 3 ewit; coke, 1 ton 10 ewit; total, 17 tons 13 cwt.

The heating surfaces are, fire-box, 156 feet; 305 tubes 1,759 feet.—Diameter of cylinder, 18 inches; length of stroke, 24 inches; diameter of driving-wheel, 8 feet; maximum pressure of steam, 120 lbs. The actual con-sumption of fuel in practice, with an average load of 90 tons, and speed of 29 miles, including stoppages (ordinary mail train), has averaged 20 81bs. of coke per mile. The award is made for good proportion of parts and superior

workmanship.

No. 536, p. 240, and Illustrations, p. 241. R. and W. Hawthonn, Newcastle-upon-Tyne. First-class passenger locometive engine. The award is made for a good arlocometive engine. The award is made for a good arrangement of parts, and fir an improved link motion.

No. 534, p. 240, and Illustration, p. 1078. Kirson,
Inontroon, and Heuvirson, Leeds. A lecomotive tank
engine. The award is made for good workmanship,
No. 473 (Prussin). Phereservor, and Co., Hoerde,

near Dortmund, Inventors and Manufacturers. Disc near Dortmond, inventors and Manufacturers. Disc wheel and bollow axie for railways. The wheel consists of a single disc of wrought irm, fitted accurately to the and and the tire by turning. On the end of the axie and in the inside of the tire, flanges are formed, and the disc being dropped into its place, as the lid of a tin box would be dropped into its rim, is then secured to these two flanges with rivets parallel with the axie. Hence there is no tendency to draw or loosen the rivets, nor are they exposed to any wear or injury when the wheel is revolving. The axle being made tubular, has its stiffness considerably increased, without any corresponding increase of weight, The whole presents an arrangement in which great strength and firmness are obtained without additional expenditure of material.

No. 555, p. 242. J. Spencer and Son, Newcastle-on-Tyue, Baillie's patent volute springs. These springs are made of a long plate of steel coiled spirally round a centre. so as to present an outline somewhat like the fusee of a watch. The hase heing supported, any force applied at the summit tends to force this inwards, and to bring the spring into the form of a flat coil. Several applications of these to the purposes of bearing-springs, buffer-springs, and draw-bur springs are shown.

and draw-har springs are shown.
No. 634, p. 246, and Illustrations, G. R. Thorney-chort and Co., Wolverhampton, Inventors and Manufac-turers. Specimens of Beigs's patent compound axis, fire, and rails. The distinguishing principle of the construction of these parts is the forming them of two different chinracters of iron adapted respectively to the kind of deteriora-tion to which each part is liable, and the strain to which it is subjected. Thus, in the wheel tire, the centre of the breadth and the inside of the flauge are formed of a hard irou fitted to resist the greater wear of these parts against the rail, while a softer and more tenacious iron is used to make those edges of the tire which are exposed to no wear. The great tenseity of this softer iron supplies the strength Ine great tellicity of this solitor iron supplies the averages required in the tire. Similarly the upper surface of the rail is formed of a hard iron, which will not wear away, and which gives strength to the rail by its resistance to the compression to which its upper surface is subjected. while the lower flange is constructed of a tough and tenacious metal fitted to resist the extension produced on those parts of the rail. The railway axles are, in like manner, formed by welding up a tough metal round a central bard core. The two metals are welded teacther in the course of the manufacture, so as to render the combination of the different qualities of iron perfect

Nu. 637, p. 246. GEORGE WORSDELL and Co., Warrington, Manufacturers. Railway axic and railway wheel-tire, forge-hammered. The iron is carefully faggoted and welded up, and the excellence of the work is indicated by the tenacity and strength of the completed axie. specimen exhibited, which has been bent cold under a pressure of 84 tons, offers a good sample of the result of the process, and is commended as an excellent specimen manufacture.

No. 646, p. 247. BEECROFT, BUTLES, and Co., Kirkstall Forge, Leeds, Manuficturers. Specimens of railway wheels and axles. Messrs, Beecroft exhibit, among others, a form of wheel peculiarly adapted for express trains, in which lightness should be combined with great strength. These wheels are constructed entirely of wronglit iron, the boss and spokes (single and double) being forged in one piece. The tires are then shrunk on and riveted us usual, Their wrought-iron disc wheel displays a mode of so dovetailing the disc to the interior of the tires as to obviate the necessity of rivets. These wheels have also wrought-irou bosses. They are commended for indicious combination and good workmanship,

Nu. 682, p. 249. P. R. Jackson, Salford Rolling-mills, Manchester, Manufacturer, Locomotive and carriage tires. The carriage tires exhibited by Messrs. Jacksou are rolled in one piece, and are admirably finished. The exhibit presents a valuable feature in the steeled tires, in which the outer and wearing surface is formed of a thin plate of steel welded (hy a process said to be peculiar to the manufacturers) to the iron. By this application it is anticipated that the tendency of the tires to become grooved will be diminished, and their durability be perportionably increased.

No. 640, pp. 246, 247. RANSOMES and MAY, Ipswich. Water-crane, patent compressed treenails, and wedges for

No. 307, p 237. J. Lee, Long Acre, inventor and Pa-tentee. Carriage break. A good example of what has been termed the sledge break. It is analogous to the drag or shoe on common roads. Instead of the resistance necessary to stop the train being created by the pressure of the break against the periphery of the wheel, an iron shoe or sledge is pressed down before the wheel upon the rail, and the wheel mounts the sloping surface of this sledge, which then slides along the rail until the resistance absorbs the via via uf the train, and brings it to rest. The resistance ereated by this break being very great, it should not be applied to all the carriages of a train at once. With this caution it is commended as a useful contrivance.

No. 530, p. 239. C. C. WILLIAMS, Glasshouse Yard. Goswell Street. A railway earriage, constructed of Moul-mein teak, varnished. This carriage is strong, convenient, and neatly executed; in the substitution of varnish for paint there is an economy, and the carriage may thereby be the more quickly repaired.

No. 532, pp. 239, 240, and Illustrations, pp. 239, 240. HERRY H. HENSON, Pinner, near Watford, Patent covered waggon for the conveyance of merchandise by railway; fire-proof when closed, and so arranged that the side or roof may be opened for loading or anleading. The award is made for the combination of corrugated iron and wood in its construction, No. 539, p. 240. J. E. McConnell, Wolverton, Rail-

way passenger carriage. This award is made for an ex-

cellent adaptation of corrugated iron to the construction of railway enrringes, and for superior workmanship.

No. 541, pp. 240, 241. JOHN COOPE HADDAN, 29 koonsbury Square. Patent railway carriage. Rewarded Bloomsbury for the application of papier maché to the construction uf railway carriages.

Honourable Mention is made of

No. 642, p. 247. M. PERCIVAL PARSONS, 6 Duke Street, Adelphi, Patentee and Designer. Among the various exhibits of Mr. Parsons, Normanville's patent axle-box deserves notice. The bearing is cutirely inclosed in a cast-iron box, which keeps the axle free from dust or sand, while it preserves the grease, which would other-wise fall on the road and be wasted. This box is cast in one piece, and around the axle is fixed a collar of stiff leather, so as to form a close joint, and prevent the ingress of dirt. As an improvement in the details of the railway system this well deserves attention.

Nu. 346, p. 969. PIERRE RODIER, Nova Scotia. Working model of a locomotive engine, made by the exhibitor. a boy 14 years old. A paper accompanying this exhibit certifies the boy to have received no nid, either in drawings or workmanship, which display ability and deserve

No. 231, p. 1451 (United States). L. C. HIGGINGO-THAM, Version, New York. Miniature model of a loco-THAM, Verion, New York. Stimuture moses of a necessary motive engine; made by a boy who lived by the side of a railway. The passing of the trains was the only information within his reach. A remarkable fact, to which the Jury would draw attention as a proof of the youth's singular powers of observation.

SECTION (F).

AWARDS IN SECTION F .- (See Table, page 188.) No. 618, pp. 244, 245, and Illustrations (England). The Council Medal is awarded to T. Dunn, Windsor Bridge, near Manchester, for a traversing frame to remove carriages from one line of rail to another.

A strong frame supported on wheels, which are covered hy its sides, travels on a railway at right angles to the lines, from one to the other of which the carriages are tu be transferred. The level of the upper surface of the transverse rail is a little above that of the principal lines, so that the latter are cleared by the flanges of the wheels of the frame, which therefore freely traverses them. The transverse line is broken where it crosses the principal transverse line is broken water it crosses me princepai lines, space being left for the trains to pass. To receive the carriage, a rail is placed like a shelf or ledge at the bottom of the sides of the frame, so as just to clear the surface of the permanent rails; and to raise the carriage upon this shelf a switch is provided, which, turning upon a hinge, may be hrought, when the frame is properly placed, into the direction of the principal line. The upper surface of this switch forms an inclined plane, op which the carriage may be raised until its wheels rest upon the The frame, with its hurden, is then pushed sideways along the transverse rail, to the rail to which the carriage is to be transferred, and the switch supplies an inclined plane by which the carriage descends. traversing frame, supplying (for many purposes) the use of the turu-table, is commended as a useful invention, affording increased facilities for railway traffic

The Price Medal is awarded to the following exhibitors:— No. 602, p. 242. W. H. Bartow, Midland Railway, Derby, Inventor. Wrought-iron permaneut way for rull-ways. The rail in Mr. Bartow's invention is made to form ways. The rail in Mr. Barlow's invention is made to form its own continuous bearing. In section the rail somewhat resembles an inverted $V(\Delta)$, with the ends considerably turned outwards. This portion farms the sarface by which the rail bears upon the ballasting, the apex of the V being formed with flanges in the ordinary form of rails; and the rail therefore beds throughout on the hallast. It can be very easily packed up and adjusted when out of place, and all the fittings of sleepers, chains, and keys are done away with, nothing being required besides the rails themselves, except a cross or tie-rod at the joints to hold them at the proper distances asander, so as to keep the gauge of the line. This rail has been tried on the Mid-land line, and the results, as shown by the diminished

increased only in a small proportion. No. 552, p. 242. C. DE BERGUE, 9 Dowgate Hill, Inventor and Manufacturer. Patent station buffer. Mr. De Bergue has aimed at producing a station buffer, which should offer to a train impinging upon it a gradually increasing resistance through a long space, thereby absorbing the vis viva of the train gradually, and without shock of the carringes apon one another; and he has sought to do this without the aid of a spring, the recoil of powerfully compressed, might be attended with danger. In his station buffer the train impinges on the cud of a long stout heam of wood, slightly tapering from one end to the other. This beam has its smaller end fitted to enter a strong iron hox or case. The force necessary to drive this taper beam into the case continually increases as the larger end approaches the case, or as the wood must be more and more compressed to eater the case. At the same time the beam, when driven in to any point hy the impact of a train, remains fixed there, having no tendency to fly out or return to its first position. All the injury which may be produced by the recoil of a powerfully-compressed spring is thus avoided, while on the removal of the carriage the iron case is easily unscrewed, and the beam of wood loosened and drawn out to assume

Among the instruments exhibited in this Section are some dynamometrical machines but little known in this country, but which have been applied in France, with great success, to determine the most favourable conditions for the construction and working of machines, with respect to the economy of power. The machines heretofare used for this purpose have been the stram-indicator of Watt and the friction-break of Prony. The former serves to determine the work done by the steam upon the piston of a steam-engine during any single stroke; and the other, being applied to a driving-shaft when all other work is thrown off it, serves to measure the work by which that shaft is driven, from whatever source it may be derived. It is the object of these dynamome-trical instruments to determine the work transmitted to the whole or any part of a machine, not for a single stroke only of a piston, but continuously, through any given period; and to do this without absorbing—as the frictionbreak does-the whole work to be measured, but whilst the nuchine is performing its customary work. The nmount of work necessary to yield given useful results is thus determined, independently of the influence of any other parts of the machine than those which operate

directly on the result, Every such admeasurement is a manufacturing constant of great value, capable of being employed to determine the cost of production under other and widely different circumstances. Such constants as have yet been thus determined, science owes chiefly to the labours of French These dynamometers have been used not engineers," only to determine the power transmitted by machinery from steam-engines and water-wheels, but to manual labour, as applied to the working of pumps and driving effort of a team of horses through successive days of labour, and journeys as long as that from Amieus, Nancy and Le Mans, to and from Paris, has thus been measured and recorded, and the work expended on such efforts estimated, aggregated by the machine, and registered in

The invention of these machines is due to General Poneclet. They were constructed under the direction of Colonel Morin.

The following are the dynamometers exhibited:—
1. The "Dynamometro de rotation," for determining the work transmitted by a revolving shaft. A dynamometer for determining the manual labour

2. A dynamonater for determining the manual moon: of driving the handle of a pamp or a crank.
3. A dynamometer for registering the work of the steam on the piston of an engine through any number of strokes. Constructed in the principle of the constant indicator, made in the year 1841 for the British Association of the principle of the constant of the principle of the pri tion of Science, and described in their Report for that It will be sufficient to describet the rotation dynamo-

* They have been collected by Colonel Morin in his "Aide Memoire de Méranique Pratique." Fifth edition.

1849, Matthias, Paris. † It is not easy to make this description clear without a drawing. For a more intelligible explanation, the reader is Morin.

meter, which is that used by the Jury in its experiments on the centrifugal pumps.

Upon an axis, having east-iron supports, capable of

being fixed by screws npoa the floor, are placed two pulleys, which we will call a and B, the one, A, is fixed on the axis; the other, B, is moveable upon it between limits hereafter to be specified. Let it now be supposed that the machine, the power employed in driving which is to be measured, is worked by means of a strap passing over two drums, one of which is upon a shaft connected with the engine, or other motive power, which we will call the driving-shaft. Let this strap be removed, and the dynamometer being conveniently placed and screwed firmly to the floor, let a strap from the dram on the driving-shaft be passed over the dram, a, and one from the dram on the machine over n; then it is plain that if B were fixed to the axis as A is, the strap passing over a would transmit the motion of the driving-shaft on to the machinery; so that the latter would be driven as it was before, except that the work would now be transmitted through the dynamometer, which before it was not. To cause the axis to carry the drain a round with it, a spring, fixed in the axis, passes between knift edges, fixed near the circumferences of the wheel n. This spring being enried round by the axis, and pressing on one of the knife edges of the dram B, carries it round with it, first deflecting under the resistance natil the force with which it tends to recover itself is equal to that resistance. This deflection being measured, measures the resistance to be overcome to drive the machine, and the space travelled by the point where it is applied, measures the space through which that resistance is overcome.

The registration of these measurements, under every ange of resistance and motion to which the machine

may be subjected, is effected as follows:-r, q, s, round which passes a long strip of paper, winding (when the rollers are put in motion) of r and ess, passing, between them, over q. Tu put them in motion a bevel wheel, whose axis—at right angles to the axis of the dynamometer-has its bearings fixed to the frame, so as to be carried round with the axis of the dynamometer, engages with another bevel wheel, which runs loose on the axis of the dynamometer, and which is held at rest by a fixed The bevel wheel carried round by the frame hrneket. and engaging in this fixed bevel wheel, carries with it the roller r, and obviously communicates in it, and therefore to the strip of paper, a motion proportional to that of the point where the spring presses on the knife edge. The roller s is made to take up the paper thrown off by r, hy means of a spiral spring inclosed in it. The strip r, ny means or a spirat spring incrosed in it. I ne strip of paper being thus understood to pass over the roller q with a motion proportional to that of the point of appli-cation af the pressure which drives the machine, let it be observed that on an arm of the drum n is fixed a style, carrying at its extremity a pencil, which is pressed by a spring upon the paper passing over the roller q. When the strap which the drum n drives is taken off, that drum

referred to the "Leçons de Mécanique Pratique," of M.

is carried round by the drum a withint resistance; there is, therefore, no deflection of the spring, and no turning of the pulley upon the axis consequent upon that deflec-tion. The trues of the pencil upon the paper will, under these circumstances, be a straight line; and in all experiments the neucil is made first to trace such a line.

When, however, the strap is replaced, and the work is out on the drum n, the latter turns upon its axis, pressing the spring upon the knife edge, and deflecting it until its resistance is equal to that opposed by the machine driven by the strap. By this turning of the drain the peneil is by the strap. By this turning of the drum the peneil is moved at right angles to the line which it before traced on the strip of paper, by a space proportional to the deflection of the spring, and, therefore, to the pressure hy which the spring is deflected; and this proportion being waiter the spring is referred, and some preparation maintained, however the pressure may be varied, an irregular curved line is traced upon the paper, whose distance from the straight line before traced upon it, is always proportional to the pressure by which the machine is driven; whilst the corresponding distance along the straight line previously drawn, being measured from the commencement of the motion, is proportional to the space described by the point of application of that pressure. Hence it is apparent that, as in the case of the common steam-indicator, the area of the curvilinear space between the straight line traced by the style before the work was put on, and the curved line traced by it afterwards, is proportional to the work done in driving it. There are

two other contrivances worthy of uotice. 1st. A contrivance for correcting the want of uniformity in the motion of the paper, produced by the diminution of the diameter of the roller r, as more of the paper winds off it. This correction is rendered necessary by the great length sometimes given to the strip of paper, This correction is effected by the intervention of a fuseewheel

2nd. An admirable method of M. Poncelet for registering in numbers in one part of the dynamometer the work which in another (as described above) is registered, under the form of a curvilinear area. This is effected on a principle, which has also been applied to the mechanical quadrature of areas, in an instrument called the planimeter, of which several are exhibited in the department of Philosophical Instruments. The two registrations serve to verify one another.

AWARDS IN SECTION G.

No. 1151, p. 1233 (France). P. CLAIR, 93 Rue de Cherche No. 1134, p. 12331 (France). P. CLAIR, 93 Rue de Cherche Midl, Paris. 1. MM. Poncetel and Moriu's rotary dyna-mometer. 2. Lapointe's constant indicator. 3. Clair's indicator, The award is made for good and intelligent workmanship in the construction of these machines, under the direction of MM. Poncelet and Morin. Among the articles exhibited by M. Clair is also an admirably constructed model of a locomotive engine in metal, the working parts of which are opened or shown in section, for explanation and instruction.

No. 761, p. 1216 (France). J. BÉRANGER and Co., Lyons. Scales, weighing-machines, and various uther im-plements for weighing. Guided by an ingenious mathe-matical theorem, M. Béranger bas so combined a system of levers that he can place one of his scale-pans at any distance from the other-according to the form he wishes to give to his weighing machine—without affecting the equality of weights which balance in the two scale-pans.

This combination of levers is simple, economical, compact, and admits of a ready application to all purposes of commerce. M. Béranger has, in fact, made that application in the collection of convenient and ornamental weighing-machines which he exhibits.

No. 944, p. 1225 (France). PARENT, 33 Ruc des Ares, Paris. Weighing-scales, weights, and measures, which

struments made for philosophical and chemical purposes, and a degree of precision and accuracy is thus attainable for the purposes of commerce, which is not to be looked for in common balances. The award is nade for an attempt to improve commercial balances, and for the admirable

workmanship of those exhibited. No. 105, p. 1013 (Austria). H. D. Schmidt, Vienna. Model of a patent weighing table.

The mode of suspending the platform on a quadrople lever, and of connecting this lever with the steelyard, is the same as usual. But a very advantageous arrangement is nande for relieving the steel fulera of the levers, when the machine is not in use from the weight of the datthe machine is not in use, from the weight of the platform, and of any carriages passing over it. Under the ints where the platform rests are the four levers; these points where the platform rests are use conwards, and nearly touching the upper surfaces of four short pillars of iron fixed into the masonry at the bottom of the pit. When the meehine is not required for weigh-ing, the long end of the lever is lowered, together with the steelyard counterpoise and framework, by means of a winch and sevew, natil the bosses of the levers rest on the pillars beneath them. The weight of the platform and any carriage upon it is then borne by these pillars, and not by the steel fulers of the fourfold levers. fulern are thus saved from much unnecessary deteriora-tion. On raising the frame with the steelyard and the end of the long lever, the weight of the platform is thrown on its fulera, and the machine is then ready for

No. 774, p. 252. JONATHAN DAVIDSON and Co., Burony Street, Ediuburgh, Inventors and Manufacturers. The steelyards and weighing-machines of these exhibitors are manufactured in a very creditable manner. The parts manufactured in a very erectifiable minimer. The parts appear well proportioned; and care has been taken to prevent deterioration, as far as possible, by apriling steel at all the points peculiarly exposed to war. The arm of the steel of the result of the steel of able for any counterpoise, as the several weights read off merely show multiples or sub-multiples of the counterpoise. The arrangements and proportions of the several parts are judiciously determined, and the whole is well finished.

well finished.

No. 784, p 283. H. POOLEY and SON, Láverpoof, Inventor and Manufacturer. Patent weighing machines. These are remarkable for simpleity, neat and effective construction, and good workmanship. The principle is alike in all. The weighing platform rests on four points, very near the fulers of a quadruple lever, as in the common street weighing-machine. One of these fourfold levers is prolonged, and at its extremity is connected with the short end of the lever, to which the scale-pan with its weights, or the sliding counterpoise, is attached.

The locomotive weighing-machine appears very deserving of notice. This consists of a system of three such tables, placed so that a locomotive running over them may have each pair of its wheels on a separate table, Then the three counterpoises may be adjusted until each one correctly balances the proportion of the weight bearone correctly balances the proportion of the weight bear-ing on its table. A bor with a light lever, and a bandlo projecting from it over each steelyard, enables the attendant, standing opposite the centre not or brick tho winations of all three, and inspect with accuracy the state of adjustment. By the use of this multiplied weighingmachine the proportion of weight borne by each pair of wheels may be tested, and the inquirer is thus enabled to alter the adjustment of the springs until he has secured such a distribution of the load as may be most likely to lead to good working.

CLASS VA.

REPORT ON CARRIAGES GENERALLY, NOT INCLUDING THOSE CONNECTED WITH RAIL OR TRAM ROADS.

[The figures after the Names (between parentheses), refer to the Exhibitors' Numbers and to the Pages in the Official Descriptive and Lauremated Cavalogues.]

Sub-Jury for Carriages,

The Earl of Jessex, Conirmon, 38 Berkeley Square.
J. Holland, Deputy Chairmon and Reporter, 258 Oxford Street; Coach-builder.
M. Ansons, France; Gagineer.
T. Herron, Squamer Hill, Bublin; Coach-builder.

M. Anson, France; Engineer. T. Herron, Summer Hill, Dublin; Conch-builder O, McDastet, United States. Anyouse Poncearr, Belgium; Engineer-In-Chief.

By the "Intractions from the Causell of Chairmen to the princin," we are directed to consider the articles coming within our province for examination, under two divisions, and to regard as qualifications of principles of the principles and to regard as qualifications of the principles of the pileation of any new material, with elegance of designs, and reconsible chemposes," and in the second data, or consider the principles of the principles of the principles of solidity for safety, durability, and chemposes.

Our examinations and awards have been made in strict conformity with these instructions. We find that the contributions in our department are apportioned among various countries as follows, viz.:—

Bath (Great Britain 60 79 France - -Hamburgh -. 3 Grand Duchy of } 1 Sanlinia 1 Austria tlunds -3 Canada -United States 8 -- 100 107 2 2

(Messes, J. Hurrox and Soxs, of Dublin (884, p. 257), exhibit four carriages, which are excluded from competition as Mr. Hutton is a Jaror in this class.)

Besides the articles in the foregoing table, we have had under examination a number of models of minor importance, patent axles, wheely, and other parts of estringes, coach-lace, &c., the peculiar merits of which are not axles, ciently cylident to entitle them to especial notice or commendation.

The fact most obvious in the display of carriages is the sexas of variety in the kind, and the absence particularly of the higher class of equipages, of travelling carriages, propry so called, and of vehicles intended "for the public service." The dress or plain vis-s-ris, the dress or plain cach, the landau, the mail-coch, &c, have no representatives in the Exhibition.

We confers we are somewhat surprised at the deficiency

in this respect; but regard it as accounted for in a great measure by the denand for carriages of these descriptions having been so materially diminished by the general introduction, within a recent period, of railways.

We are also of opinion that the trade is not fairly any

more than fully represented, and that the set of carriagemaking has attained a point of excellence which would werrant the expectation of a light verification of course very generally the set of inspries words, beather, and extra prices and the set of inspries words, beather, and extra prices are set of inspries words, beather, and extra prices were set of the set of the set of the set of the prices were set of the set of the set of the set of the prices were set of the set of

the continging the state of the art of corrisposhtilling of former and not very distintt times with that of the prosent, we consider the principles of huilding in many respects greatly improved, and particularly with reference to "lightness" and a four regard to "strength," which service the properties of the property of the contraction of the state of the contraction of the contraction of wheels and other parts requiring "artering hand lightness" conditions, a most required to the properties of the contraction of wheels and other parts requiring "artering hand lightness" conditions, a most required to the contraction of the contrac

We observe many innovations and contrivances in springs, steps, fore-carriage locking movements, &c., which are not always improvements, and yet convenience and nice adaptation have been much advanced in these resports also within a few years. We notice a justify metricorious and very time automatie step on the carriage of Mr. David Davies of London (292 p. 256), and an ingracious spring door-lock on a carriage of M. Mousard of

Paris (67, p. 1207).

In our judgment the appearance of the earriage has not been improved by a deviation quite consons from the lines hitherto adapted and approved, and we regret to remark, under the head of "elegance of design," that we find in that exhibition of carriages a great defining the properties of the pro

eines incorraion.

THE Jury for "Manufacturing Machines" have inspected the articles contained in that Class of the Exhibi-

tion, and have to Report thereon as follows: They find it to contain a collection apparalleled for number, importance, ingenuity, beauty of execution, and every quality by which the machines of the present day are distinguished; but they desire carefully to guard against the supposition that every branch of mountaeturing mechanism is represented. On the contrary, great inequality prevails in this respect; some manufacturing processes being ohundautly and almost amerikacusily illustrated, others wholly quitted, and the remainder re-

presented by very few specimens. The textile processes in general, the preparation and spinning of cotton, flax, wool, and silk, weaving in all its branches, are, for the most part, well illustrated by the public spirit of various exhibitors, who have not only sent complete series of the respective machines, but olso mointoin them is motion, doing work, so that these materials are octually shown to the visitors is their gradual progress from the raw state to the saleable product, But even in this division many machines are necessarily omitted, especially if the nature of their work units it to be carried un in the presence of a crowd of spectators.

Such are the preparatory washings and cleansings of raw unterial; all kinds of fulling, colendering, dyeing, and the like, which either derive their sole interest from and the like, which either iterity their sole interest freis processes that ore occumpanied by excessive noise, dust, disagreeable smells, splashing and spilling of water and other fliquids, or similar nanoying phenomeum; or are of such a mater as to occupy time, or demand noire care than can be bestowed in the presence of an assembly of spectators; or which require peculiar conditions of temperature or other arrangements incompatible with a public exhibition. Paper-making may be placed under this head, and consequently only o few of its models and machines are exhibited; and those, at rest.

For completeness and value, the collection of machine tools for working metal and wood may take its place next to the textile mechanism; and here may be seen speci-mens of nearly every one of the engines that have been introduced in the present century by our machine makers, and by means of which the construction of the vost and

complicated muchinery that now pervades all classes of industrial occupations has been rendered possible. the anguitude of the work usually executed by such engines-the steadiness of foundation which they require, and which is must tainable in this building - and other considerations, appear to have prevented the exhibition of their action; for although they are placed in the department of mechines in motion, and some of them are actuelly kept in motion to part, no work is placed upon them. For obvious reasons, oil processes of working metal which require heat are impracticable, and very few of the machines which helong to such are here to be found. Thus the reduction of metals from the ores to burs and sheets. end all founding or easting processes, ore wholly unrepresented, as well as the curious and interesting operations belonging to the glass and pottery manufactures To these may be added muchines which are so bulky or To these may be some more meaning where we so sussly deranged as not to justify, in the opinious of their owners, the risk and expense of removing them to the Exhibition, or the sacrifice of the work which they

are producing in their own manufactories A great voricty of printing presses will be found in A great vorcety or invating presses and se runn in the collection, mony of them maintained in constant action; also mony mills for grinding and crushing vege-table producps, with the elcousing oud sifting apparatus connected with them; but of course not exhibited in action. Besides these, there are various miscellaneous machines which will be indicated as we proceed. Enough, however, has been said to show that the present collection does not represent the real extent to which machinery is employed in the manufactures of this country, seeing that, at all events, those machines are omitted which derive their sole interest from the processes with which they are connected, and when these are of such a nature as to forbid their being carried on in the presence of an assemblage of spectotors or in an armomental building. assemblage of spectotors of at an information annual, it will be remarked that the greater part of the machines which ore exhibited are sent by their makers and not by manufacturers.

The above remarks are more especially directed to the British part of the Exhibition; but they apply with still greater force to the foreign, in which the distance of the respective countries and the risk of damage to the meCLASS VI.]

chanism have necessarily interposed many difficulties to the transmission of large, valuable, or delicate objects of this description. Hence, notwithstanding the considerable number of beautiful and ingenious machines that are placed in the eastern division of the building, any attempt to estimate from this collection the relative employment of machinery in any branch of manufactures by their respective countries, or the relative standard of excellence which each has attained in the construction and contrivance of machines, would lend to the most fallacious and unjust conclusions.

The machinery of the Exhibition, and the foreign machines especially, must therefore be looked upon as a collection of miscellaneous articles, sent by individuals without any principle of concurrence or any attempt to ensure the fair and equable representation of every class of manufacturing machinery, or of the styles and mode of workmanship which prevail in different countries or districts

It will of course be understood that the above remarks are strictly confined to the articles which belong to the class of manufacturing machines; for the portions of the cases on miningers and manufactor, for the portions of the shallding wherein they are placed also contain many of those that are included in Class V., especially in the foreign departments, in which the machines of the two Classes V. and VI. are also mixed up with agricultural and other mechanism of all kinds, and with hand-tools and manufactured articles that properly fall under the denomination of "cutlery" or "general hardware." not been sent by their respective exhibitors, or they prove upon inspection to be either models of small importance, or to have been so daranged by the transit as to make it impossible to set them in motion, or form any just opinion of their merits, especially in cases where the exhibitor is neither to be found, nor has left any representative capable of explaining them,

In round numbers it appears that the English exhibitors amount to about two hundred and twenty. France has contributed between fifty and sixty; the United States, fifteen; Belgium and the Zollverein, ten or twelve each; Russia and the Netherlands two or three; while Sardinia and Switzerland have merely sent some machine-tools used in the manufacture of watches. Since it thus apcars that the machines sent by each country, whether Pears that the accurace seet by case comments the little of project bear no proportion to the relative employment of machinery, considered either with respect to geographical distribution or to the different departments of manufacture, it will be useless to examine each country by itself. In the following more detailed survey of the functions, including under each head all those that have been contributed by the different nations

(A.) Convension of Raw Material into a continu-OUS THREAD, AND SUBSEQUENT PROCESSES,-(1.) Cotton. (2) Wool. (3) Flax and Hemp. (4) Silk.

(II.) APPARATUS FOR BREWING, DISTILLING, AND MANUFACTURING CHEMISTRY.

whose zeal, ability, and diligence, we have been so greatly indebted throughout the whole period of our labours.

(A.) Conversion of Raw Material into a continuous THREAD, AND SUBSEQUENT PROCESSES. (1.) Cotton.

In the exhibition of machinery for spinning, and its preparatory processes, Messrs, Hunner, Platt, and Sons (1, pp. 263-268) have taken the lead, by establishing and maintaining in operation a complete series, beginning with the opening uncline and scutcher, and in-cluding the various carding engines, the drawing, slubbing, and raving machines, two relf-acting nonles (the one adapted to the weft, the other to the warp), and also a threatle, a winding-machine, and a doubling machine. This spleadid series of nincteen machines is of their own manufacture, and contains many improvements on the ordinary constructions, besides infording a complete picture of the progress of the raw material from the state in which it is imported, to that in which it is delivered to the weaver. Attention must also be directed to the beauty and excellence of the mill gearing and its framing, by means of which these various machines receive their notion from the steam-engine. This part of the work is exhibited by Measrs, Htcs and Sos, of Bolton (1, p. 268). The cotton cleaning and opening machine of the above The cotton cleaning and opening macrine of the most series is on Mr. F. A. CALVERT's construction, who also exhibits (27, p. 271) other specimens of his new and effective method of making wool-burring, cotton cleaning, and carding cylinders.

Other makers have sent admirable specimens of some of these machines, each distinguished by peculiarity of construction, important improvements, workmanship. Amongst these the new throstle of Messes, SHARP, BROTHERS, and Co. (15, p. 270), is remarkable. The principle of this machine, which is derived from America, is-that a small loop running on a ring is substituted for the usual flyer, whence it is termed "the ring and traveller threatle." The framing and disposition of its parts are greatly improved by the present

makers Mesers, Higgins and Sons (14, p. 270) exhibit their roving-frame, and Mr. J. Mason (10, pp. 258, 269) a drawing-frame, in roving-frame, and a slubbing-frame, furnished with their patent collars, by which the spindles revolve with greater stendingss, and an increased velocity can be attained. Also separating plates for the slubbings, and a hrake motion for more effectually stopping the exhibit an extensive contribution of machines, including a carding-engine, drawing, slubbing, and raving-frames, and three parent self-acting nules, each of a different construction. A new self-acting nule is also shown in operation by Mr. G. P. Macriston (24, pp. 270, 271), in which a radial arm is employed to produce the return motion, or putting-up of the carriage. Mr. R. SUTCLIFFE (42, p. 273) exhibits a doubling-trame of an improved construction, in which the fiver is drawn by the bobbin, and other arrangements are carried out for the purpose of obtaining a high velocity. Messrs, Gaunner and Bazger (87, p. 279) contribute a small doubling-frame for lace thread, in which the spindles are driven by connect wheels in lien of bands, an arrangement that has also been used in the throstle of Messrs. SHARP sirendy debeen used in the investie of ofesiers, Shahr arready described. Mr. Pattesov (3. p. 271) exhibits a machine for winding cops: M. De Footante Moneau (p. 273) a sunde of driving spindles with tooth goar, and Mesers, Lawrs and Mr. Lawre (209), p. 293) a spindle for roving, slubbing, or doubling, which considence the datatage of

top bearings with facility of doffing.

The Foreign Department contains very few machines for the manufacture of cotton,

Mr. Rrsta (France, 1438) exhibits a machine, which he serms "L'Epurateur," for opening and cleaning cotton upon a new system, that promises great advantages; and Messri. Syamu and Co. (France, 1021, p. 1227) We cannot conclude these prelimenary remarks with-out expressing our cordial thanks to Colonel Lloyd; to ship, in which the spindles are wholly driven by spar-or 2

ecls. From Belgium, the Phienix Company (134, 1155) have sent a well-made "soft-bobbin" frame, in p. 1155) have sent a well-mode "soft-hobbin" frame, in which the cone and pulley, usually employed to produce the variable motion required by the bobbins, are replaced by a group of spur-wheels. Mr. W. HAYOEN, of the United States (368, pp. 1461, 1462), exhibits a drawing-frame for cotton, with an ingenious self-acting mechanism. Frame for regulating the weight of the slubbing, and Mesers.

BATES, HYDE, and Co. (440, p. 1463), send a saw-gin for cotton. Mesers. W. and C. MATHER (16, p. 270) exhibit a calico-printing muchine, for printing eight colours at one operation.

(2.)-- 11'col. The machinery for the woollen maunfacture, notwith-Are mecanory for the wooten mammediare, botwith-standing its extent and importance, in very slenderly represented. Mr. G. E. Donistriumer (40, p. 273) con-tributes a machine for long-wool combing, recently patented, on a new principle, of great ingenuity and admirable pronise; and Mestra, literar and Soxs (48, p. 274) have furnished a series of the six machines. employed in the manufacture of warsted yarns, of the best workmanship and of improved construction. By best workmanship and of improved construction. By these the complete progress of the unterial, from the state of a sliver to the spisming, inclusive, is shown in daily operation. Mr. Masos (46, pp. 268, 263) exhibits, in the short-wool department (or clothing branch), two carding-machines and a mule. These deserve especial on the Continent, and universally in the United States. by which endless sluthings are formed directly from the card The old hilly-machine, and the operations concard. The old hilly-machine, and the operations con-nected with it, are thus dispensed with, and the yars produced is more level. Mr. Mason's machines contain several important improvements, of his own invention; especially an apportus for condecating the slubbing from the first card. In the French Department, a set of woolken machinery, on the same system, is exhibited by Messrs, Mancien and Co., of Louviers (632, p. 1208); namely, two carding-machines are of highly-finished workman-mule. These machines are of highly-finished workmantwo carding-machines and one semi-self-acting mule. These mactimes are of nignty-massed workman-ship, and in the best style of modern French machine building. In this department (283, p. 1190), Messrs, Lacavex and Soxs contribute a fulling-machine, of admirable construction upon a system which has entirely summane construction upon a system which his chitrely superseded, on the Continent, the old method of fulling-stocks. In the English part, Mr. E. Huwr (49, p. 274) exhibits a gig-mill, of a new and simplified construction, which, by working on both sides, and thus finishing the process of dressing with teasels, without removing the eloth from the machine, is rendered capable of turning

out considerably more work than on the usual system.

The English mechanists have not contributed a single The English mechanists have not contributed a single slearing-mochine, but in the Fureign Department there are exhibited several of very ereditable workmanship, mamely, by Mossrs. Throuse (Firsts) a57, p. 1060), II. Theorem Broomings (Belgium, 128, p. 1153), and SCINELDER and Lizanaxo (France, 1001), p. 1227).

(3.)-Flax and Hemp

The Flax manufacture is represented, in the present collection, with the same spirit and completeness as the

Mr. R. Plemmen exhibits his patent rotatory disc machine (74, pp. 275-277), with other machines for break-ing, entting, and dressing flax; also his application of gutta erchn to the holders. Mesurs. Lawson and Sons con percha to the holders. Messrs. Lawson mas Sons con-tribute a set of sixteen machines (75, pp. 277, 278), which, for heauty of execution, value and completeness of illustratium, are fully equal to those which Messrs, Himacar have furnished in the department of cotton. These mediates are divided into three series, that include the three departments of flax manufacture; namely, the tow, the long flax, and the cut flax; and they contain all the machines med in each respectively, by which the raw material is converted from the form in which it is imported to the thread, as delivered to the weavers, or others, by whom it is employed. Among them are the machines by which the spinning of flox has been so greatly facilitated by substituting cold water for warm.

which was formerly employed to the great detriment of the health of the workpeople. Messrs. Hingains (14, p. 270) have also exhibited excellent specimens of the four machines employed in the long flax spinning, and

tour machines employed in the root one spinning, and the preparatory steps which belong to it. In the article of Henp we find only the large machino of Mr. J. Crawmal. (78, p. 279), by which yares, spun by processes not exhibited, are converted into a rope. This machine, compared with the previous ones, from which it is derived, is remarkable far simplicity of

The Foreign Department does not contain a single machine relating to the flax manufacture.

(4.) - Silk.

The simpler machinery of the silk manufacture is com-pletely exemplified by the beantifully-finished machines of Mr. J. L. Davespoat (80, p. 279), which include the complete series employed in that branch, for throwing, winding, cleaning, spinning, doubling, and reeling; the whole of which are exhibited in operation. Mr. J Fuort (84, p. 279) also cuntributes models (or rather, short portions) of his improved machines for winding, cleaning, throwing, &c., and of his spinning and doubling machine, in which the two operations are performed by

one process.

One process.

One process.

One of the control of th

From this rapid survey of the machinery in the Exhihition, for converting the raw materials of cotton-wool, flox, and silk, into a continuous thread, it appears that wearly all the processes are represented, and some of them in the most satisfactory and complete manner. It is to be regretted that no specimens have been sent of the curious machines, by which enoutehout is manufactured into a continuous line.

(B.) - WEAVING OF ALL KINDS. (5.)-Looms

We may now proceed to the various classes of locans, of which a great variety are placed in the Exhibition, and most of them maintained in operation, either by power or hand; many of them also are remarkable for novelty of construction and for important improvements, which can only be alluded to, here, as it would be which can only be influed to, here, as it would be impossible to render them intelligible without the aid of drawings or very long descriptions. Those, however, which appear of the greatest importance may be meationed

E. and C. PARKER's power-loom for said Messrs, C. cloth (77, p. 278) is distinguished by peculiar and effective arrangements for maintaining the uniform and regular delivery of the warp, and a constant but adjustable ten sion in the taking-up motion, by which the firmness of this important article of manufacture is insured

Mr. Baows (56, p. 275) also exhibits a sail-cloth power-loom with peculiar arrangements, adapted to the me objects

In Mr. Barlow's double jucquard loom (82, p. 279) two cylinders are employed, and the cards are disposed upon there in alternate order, so that, while one cyhnder with its cards is brought into action spon the horizontal wires, the other is withdrawn for the purpose of rotating it, and shifting the card, and rice erest. By this arrangement the loops can be worked with a valuation of the card, and rice erest. ment the loom can be worked with a velocity 40 per cent, greater than that of the ordinary construction: the steadiness of its action is greatly increased, and the strain apon the warp diminished, by another improvement, which consists in lowering the warp threads as well as raising them; whereas in the ordinary jacquard loom those threads which are not carried up by the lifting bars are allowed to remain in the horizontal position.

The power-loom of Messys. Kixwourtwi and Illellocan (21, p. 270) is characterised by two self-acting methods of stopping the loom by throwing off the belt; the one when the well breaks, the other when the shuttle traps, that is, sticks in its course through the shed.

Mr. Mason's large loom for wool (10, pp. 268, 269), has a motion which releases the swell of the shuttle-box at the instant of picking or driving the shuttle, whereby the force required for the latter operation is greatly diminished.

Mr. M. Ssittii (22, p. 270) exhibits several powerlooms with a poemiar mode of delivering the warp; one of them has a self-section for changing the shuttles, and thereby working in three colours in any desired order, the changes being governed by a kind of jacquard

Mr. FROMAGE (France, 219, p. 1184) contributes a powor-loom in which two shuttles are employed, and shifted by an endless chain, provided with inspects fixed in the order required by the pattern.

in the order requires by the pattern.

Messrs, Taxton and Sox's power-loom (23, p. 270) is provided with four jacquard cylinders working simulaneously, and Mr. Chatatran (32, p. 273) exhibits a large power-loom for damask-wearing, provided with a jacquard and some new armagements.

jucyuard and some new arrangements.

Mr. Carcirrox's model (35, p. 273) shows a taking-up-motion that adjusts itself to the increasing diameter of the eloth beam with more precision than any previous contrivance.

CONTITUENCE.

Other looms are exhibited by Mesers. Harrison (18, p. 270), Hennixu (44, p. 273), Elliott and Hexs (50, p. 274), Milligan (38, p. 273), Choos (64, p. 275), and

Various applications are shown of small jucquard machine which are to the heldlest of pover-fooms in few of tappets, or in other ways, so as to produce dispers or other figured patterns of limited range; as, for example, by Meses, Geruzat (Edg. 183, p. 1125), M. Serrin (22, p. 201), A Surrin (33, p. 273), Maser (6, pp. 248, 264), and patching the reals, will adapted for small wextern, is shown by Meses. Boxansut, Granis, S.A., p. 1050, and a reader with keys similar to those of an organ, by Mr. MacKassati, Col. p. 273).

Mr. De Fontaine Moreau (30, p. 273) exhibits a jacquard loom, in which a cylinder like that of a barrel organ, and provided with pegt that can be shifted to sait any required pattern, is substituted for the usual chain of cards.

(6.) Lace Frames.

Mr. Bunkin (94, p. 280) exhibits, in operation, a single ther jacquard hobbin-act machine, making figured bace. This machine is of excellent workmanship, and most judiciously arranged, combining all the recent and important improvements in this branch of manufacture, Mr. Sewatz. (92, p. 279), one of the jurears of this

Mr. Sewell (92, p. 279), one of the jurors of this class, contributes a double-tier bobbin-net-machine, making Brussels net, combining great simplicity of arrangement and symmetry of proportion with efficient operation.

Mester, Ball, Dennichter, and Co. (90, p. 279) maintale, in operation, a warp-lace machine, making slik blond, of excellent workmanship and design, and remarkable for the noiselessness of its complex movements. A frame for "gassing have"—that is, for burning the minute fibres from it by possing it rapidly over gas flames, is exhibited by Messers, Bertrox (96, p. 289); but

finance, is exhibited by Messrs, Beurox (96, p. 280); but they are unfortunately prevented from showing this most interesting process by the necessary restrictions against the introduction of gas into the huiding. Messrs, Hirmon and Borrons (88, p. 279) show a lace-

Messrs. Herson and Borron (88, p. 279) show a lacedressing machine of superior construction, but are also prevented from exhibiting its operation by the nasuitableness of the process.

(7.) Stocking or Hosiery Manufacture, In this Department are several machines, both English and foreign, well worthy of remark, Messrs. T. and

and foreign, well worthly of Poinars, Moore, 1, and and foreign, well worthly of Poinars, Moore, 1 and
Of circular bookey frames Mr. CALTHENK (66, p. 270) the Eaglish Department chilibit two, and Mr. Acques, of Troyac (346, p. 1204), in the French Department, there These machines, which are nearly identical, sor the factor of the following t

The circular frames of M. Baxtustor (France, 422, p. 1198, 1199) are more complex than the above; the stakers are stronged in a borizontal position, and revolves with the frame; but these maschines will produce fabrica of a facer description, and of flux and silk, materials which are instructible in the finance above mentioned. In the Belgian Department (122, p. 1153) will be found a small circular hosiery frame, by M. JOVYEN.

(8.) Heald Mackines, Sewing Mackines, &c. Two machines for weaving healds for looms are exhibited in this collection. That of Mr. JUPRINS, in the English Department (52,

p. 1374), is an ingenious application of the principle of the common plaining muchine to the production of a heald, combined on a new system, completely free from knots or other obstructions to its action, and to the pessage of the warp.

The machine of M. Doney (France, 823, p. 1220) is

a beautiful piece of mechanical combination, and the health, although different from the above, is also without knots. Plaiting machines of the asual construction are show by Mr. Vax Miranto (Belgium, 133, p. 1155), and M.

hy Mr. Van Mirrio (Belgium, 133, p. 1155), and M. Eursvell (Prussin, 54, p. 1681). Under this head we may also notice three ingenious and useful contrivances in the French Department, namely, a small frame by M. Forcurar (877, p. 1220) to enable poor working or cottagers to weave slippers with case and rapidity; a frame for weaving wigs by M. Caotsar (1574, p. 1292); and a large machine for sewing sacks by M. SCENCHAL (475, p. 1194).

An effective and ingenious machine for sewing with two threads is relibited in section in the American Department by Mr. BLODUET (351, p. 14-8). A somewhat similar one is shown by Mr. JUDETN in the English Department (52, p. 27-8).

(C.) Paper and Printing, (9.) Paper-making, Cutting, and Folding.

We now come to the curious and useful process by which worm-out and dirty rags, old ropes, and such-like inpairantly worthless matter, are wreaping into paper. Het unfortunately, as in many other cases already almoded to, the noise, diamp, and heart with which the operations vertical them from being shows, and induced for the most part the unchines are only represented by Medels. Mearst. Cowar and Sox (166, p. 289) exhibit a model

Mestrs, Cowax and Sox (166, p. 290) exhibit a model of a pull-meter for regulating the supply of palls to be of the sleets; Mr. FOLKRINKER (106, p. 290) a model of the sleets; Mr. FOLKRINKER (106, p. 290) a model of his original patent paper machine; and Mesors, Downoodle of a complete series of machines, with their apprenuence, for making paper, countaining all the latest improvements which be loss introduced into this improvements which be loss introduced into this improvements. On the contradiction of the paper of
making mashine. Derriess of the process are illustrated by other exhibitors, as in Mr. Warnov is improved judy-strainer (16, p. 18). Warnov is improved judy-strainer (16, p. 18). Warnov is my constant (16, p. 18). Warnov is my constant (16, p. 18). Warnov is my constant (17, p. 18). Warnov is my constant (18, p. 18). Warnov is my

In the French Department (717) there is a complete suite of paper machinery of the full size and of excellent workmanship, containing all the appurtenances for moulding, drying, laying, and cutting the paper, by Messus,

ing drying, laying, and cutting the paper, by Messex, Vankata, Minuscarco, and Exax, Le, p. 213). Mr. W.Lsox, (112, p. 200) exhibits his admirably constructed and need in achieves for cutting paper, carderized and the constraint of the constraint of the convertically, and in the other, which is more especially included for mill-boards, it desceeds diagonally. In the Freeds hyparament, M. Borrina (101, p. 120) has a more stagonally in a borrinant place.

motest diagonality in a forthfolia plane.

Two machines for generality and folding envelopes are
Two machines for generality and folding envelopes are
the statement of the stat

of the envelopes,
Mr. Black (188, p. 283) has an effective machine for
folding printed sheets, whether 8vo, 12mo,, or 24mo,
to weighper's, &c. with precision and rapidity; and Mr.
TATION (186, p. 283) a machine by which flat circular
dises of paper are neatly monided into hemispherical
lamn shades.

Mesors, Chuscu and Goddard (135, p. 283) exhibit a machine which cuts sheets of card-board into packs of

The machino of Mr. Adorano for making eigenettes (448, p. 30a) is principally employed in cutting, wrapping, and folding the ends of the paper envelopes in which the tobacco is enclosed, and may therefore be included under the present head. In this beautifully contrived meolianasm are endless sheet of paper is applied at one end, together with the requisite tobacco, and after passing through fourteen operations those materials are delivered at the other end in the shape of complete eigarettes.

(10,) Type Printing,

An excellent machine for founding type in exhibited in the Zollverein section by M. LEONMARDT, (55, p. 1050) by which 4,000 types can be made in an hour; and similar machines by Mesors, Hopsmans (12, p. 105) and BACKMATS (13, p. 1105), in SARON, for founding and and institute of the control
and justifying type.

In the Eaglish part, Messrs, Hanniso, Pullers, and Jonnson (102, p. 280) exhibit the patent approtype machinery, of which they are the proprietors. Hy this apparatus type is formed from ecoper, sinc, or other metals without heat, by means of dies and pressure, and

is also dressed nod regulated by the machinery. The GUTTA PERCHA CONTANT of London (424, p. 301) contribute sucrectype plates of gutta percha (with specimen impressions), in connection with a large unfinished machine intended for printing therewish on codders paper, which is also to be cut and folded before it leaves the nuchine; the gutta percha types not requiring the paper to be damped.

Mr. Cookx (118, p. 280) shows a new arrangement of type-boxes for compositors; and M. Soarsexx, in the Danials section (13) exhibits an ingenious machine for composing and subsequently distributing type—this machine has not, however, had the advantage of expedition has not, however, had the advantage of expe-

of fraining-presses worked by hand, the following sexchibited-i-19, Mesers. Covenance and Levracov, 0.1, p. 279), with self-inking apporatus; by Mesers. Surrawity, Core, and Co (104, p. 220); by Mesers. Earl W. ULLENG [121, p. 280), also with self-inking apparatus; by Mesers. CAVILI and DINON (124, p. 229); by Mesers, p. 280 and Core (165, p. 280); and in model by Mesers. CAVILI and DINON (124, p. 292); by Mesers, [124, p. 280], and Core (165, p. 280); and Cons (106, p. 283).

p. 283).
Two forms of a hand printing-press, of novol arrangement and excellent workmanship, are exhibited by Messrs.
RANSONER and MAY (640, Class V., pp. 246, 247), one of which has a self-inking apparatus.

Cylinder printing machines are exhibited by Mesers, Natien and Son (158, p. 285); by Mesers, Waternawa and Sons (164, p. 285); and in model by Mr. Cowpen (134, pp. 282, 283).

The Scandinavian press of Messrs, Horktsson and Cope (162, p. 285) is worked by power, but has a vertical pressure.

tical pressure. In the great machino by Mr. Applement, exhibited (122, pp. 290, 281) by Mr. Inchana, by which the "Illustrated London News" is printed to the Exhibition, the printing cylinder is placed in a vertical direction. Four timese for supplying the paper are fixed in a radiating position from the centre, thus allowing four sheets to be prioted in each turn of the cylinder.

Another printing machine, in which a stereotype plate is curved to fit the circumference of a cylinder, is exhibited by Mr. Nelson (120, p. 280).

(11.) Numbering, Paging, and Ruling Machines. Messrs, Chuncu and Goupand exhibit (135, p. 288) an

and the second s

(164, p. 253), and ny Standard are exhibited by Mr. Snaw 33, p. 539). Machines for ruling paper are exhibited by Mr. Snaw (110, p. 280), and, in the French section, by M. Batchitz-Variation (413, p. 1198), the latter is arranged (in the manner of cylinder printing machines) so as to rule the paper on both sides before it quits the machine.

pour la Carrelle

(12.) Lithographic, and Copper-plate Presses,

In the English section the following Lithographic In the English section the following Lithographic Pre-set and exhibited:— By Mr. Sharwood (103, p. 250), in which a mangle wheel is used for producing the motion of the stone; by Messrs D. and J. Garto (114, p. 280), with side lever and registering apparatus; by Mr. STRAKER (142, p. 283), with similar appendages by Messas, M'Crora and Co. (160, p. 285), for a zine plate, which is arranged over the leather cover; and by Mr. Usdrawoon (473, Class V.), which is chiefly adapted for printing in colours. In the French section we also find a press, by Messrs. Lacaotx and Sox (283, p. 1199), and another by M. Brisser (449, p. 1199), in which the top lever is turned sideways instead of being raised apwards as usual.

In the English section Messrs. D. and J. Grand (114, p. 280) exhibit a copper-plate press, and Mr. Founna-nus a press (100, p. 280) to be worked by steam, and intended to print impressions, which are to be transferred tu earthenware or china. This is accompanied by a spechuen of his pottery tissue paper, in one continuous length of more than two miles and a hulf, manufactured from old coal-pit ropes and hawsers.

(D.) WORKING PARTS OF MACHINES.

In all machines there are certain parts which actually do the work for which the machine is constructed, the mechanism serving merely to produce the proper relative motion of these parts to the material npon which they operate, and these working parts being the tools with

which the machine operates.

Accordingly, in machinery for spinning and its pre-paratory processes, for weaving of all kinds, and for paper-making, there are a variety of such working tools, as, for example, spindles and flyers, fluted rollers, beckies, wool, and silk, weavers' reeds and shuttles, the wire cloth employed by paper-makers, &e., the making of each of which articles constitutes a distinct branch, and is carried on by a different set of workmen from those who make the machines. For the machine-makers usually purchase these parts from their proper makers when they fit up their mechines for sale, as the manufacturers and their workmen do when such parts are worn out.

Specimens of all these working parts bave been transmitted to the Exhibition, and placed in Class VI.; although it might fairly be questioned whether they ought not rather to have been submitted to the judgment of the manufacturers, whose daily experience teaches them the qualities necessary to enable these working tools to perform their office well, nud last the longest time-qualities which are quite independent of the merits of the machinery which sets them in motion; for as the best lathe will make bad work with u bad tool, so a good earling-engine, and a good loom, will fail, if fitted up with imperfect card-clothing, or ill-made reeds and shuttles; und reversely, the best tools are useless if attached to a bad machine. However, we may proceed to direct attention to the principal specimens of this kind, premising that many exhibitors have transmitted glass cases contain a few such articles that can be looked upon in no other light than as pattern-eards.

In the English Department we would select, for par-In the Engine Department we ticular attention, the spindles of Mr. Prescon (5, p. 258); the reeds of Mr. Dr. Bezone (45, p. 274); heckles by Mr. J. Taylor (51, p. 274); and a wool-comb by Mr. Juny Pract, of Bradford (suspended against the woolcombing machine of Mr. Doxtstnoars) (40, p. 273). Besides these there are others, apparently very good, but so few of each as not to afford an equally good criterion of merit. In the French section Musers, Papavoine and CHAYEL, of Rosen (309, p. 1193), the exhibitors of a machine for making earst-elothing, already mentioned, also exhibit some samples of its work, Messrs, Scarve BROTHERS, of Lille (1005, p. 1227), contribute excellent samples of card-clothing for cotton and wool, some having the teeth set in leather, others in Hursfall's patent card cloth, Messrs. Minoupz BROTHERS, of Rouen (645, p.

1207), also send excellent specimens of cards for cottons tow, sitk, and wool. Mr. HARDING COCKER, of Lille (864, p. 1221), furnishes a large number of capital beckles. gills, porcupines, and combs. Meners, Dandor, Mall-Laro, Luco, and Co., of Manbeuge (491, p. 1201), exhibit well-made spindles, rollers, bolsters, steps, &c., Many other exhibitors in this class are to be found in France, Belgium, Spain, Switzerland, and the Zollverein, Some reeds, by Madame Currae, from Tuserny (72, p. 1295), merit notice.

(E.) ENGINEERS' TOOLS FUR METAL, WOOR, AND OTHER . MATERIALS.

Amongst the machine tools, lather, as might be expected, appear in the greatest number and of every variety of size and arrangement, from the powerful machines which are capable of turning wheels 7 or 8 feet in dinmeter, or shafts 36 feet in length, down to the delicate lather used by amateurs, or the nukers of small machines and apparates. However, it must be remarked, that in this collection, complete as it is, several important machines are not represented, as, for example, the colossal lathes which are employed for boring cylinders.

A magazineent railway-wheel lathe, with two opposite headstocks and face plates, and two compound slide-posts to correspond several and two compounds lide-posts to correspond, capable of turning wheels above seven feet in dimneter, is exhibited by Messes, Sigany (204, p. 291), and one of smaller dimensions by Messes, Wattreourn and Co. (201, pp. 287-90), who also contribute two of their potent duplex lather, in which the work is acted upon patent duplex lattics, in which the work is access upon simultaneously by two tools cutting at the opposite ex-tremities of the same horizontal diametrical line. Thus vibration and deciation of the work in shaft turning is wholly prevented. The beds of these lattices are 18 feet and 35 feet in length re-precively, and the latter is provided with two duplex slide-rests, which can be made to valid with two daspics, sources, the same travel sinutaneously by self-action, either in the same or opposite directions at pleasure, so us to economize the time required for finishing the work. They also exhibit a 5-inch self-acting foot-lathe, with complete management of the self-acting foot-lathe, with complete management of the self-acting foot-lathe, with complete management of the self-acting foot-lather with complete management. rangements for sliding, screwing, and surfacing. Large iathes of excellent workmunship, each having some peculiar facilities in the details, and adapted for sliding, screwing, and surfacing by self-action, are exhibited by screwing, and surfacing by self-action, are exhibited by Messer, Shirth, Bracock, and Tankhert (230, p. 295), Pain, Cherris, and Maderaky (313, p. 292), Sakheroine, Owick, and Marson (224, p. 294), and Shirk (220, p. 295). Mr. Muta (206, p. 291-2), com-tributes a well-anade mail. foot laths, with a variety of screw stocks and other tools.

In the American Department, a lathe sent by the LOWILL MACHINE SHOP (447, p. 1464), of 12-inch centre and 13-feet bed, with the usual arrangements for selfaction, will be looked on with great interest, as a specimen of first-rate transatlantic workumuship in this branch, and as offering various peculiarities of form and distribution of metal, the latter being employed as sparingly as possible on account of the great cost of tron. Hence a lightness of construction carried to the extreme point consistent with strength and stiffness, which presents a singular contrast to the solid proportions adopted by our own engineers,

In the smaller class of lathes Messrs, Holtzaperer, and Co. (232, p. 295) take the lead, by exhibiting a first-rate coccept parameters are the read, by extraording a risk-nate measure lathe, provided with all the appuratus required for ornamental turning, such as oval, excentric, and drilled work, and a variety of tools and contrivances uppertaining thereto, of the most elegant and perfect workmanship. Mr. Dalasty (226, p. 294), has a highly-finished lathe, to which is appeuled, amongst other things, his useful chuck, which is capable of fixing perfectly ecutral u wire of may sire not larger than 1-inch. Other Buthes are contributed by Mr. Williams (234, p. 295), with a new tool-holder and self-acting serew cutting apparatus; by the Messrs. KNIGHY (614), who have apparatus; by the herers, Kneint (e1s), who have fitted up a complete numeur-work cabinet, and by Mesors, Eants and Sox (224, p. 294). Mesors, Mondan, Saurrox, and Co. (205, p. 291), send a new machine for tracing rose-engine patterns, M. HAMANN (Prussin, 58, tracing rose-engine patterns. M. Hamann (Prussia, 58, p. 1052) has a highly-finished numateur lathe, adapted for turning either in metal, or wood and ivory, and provided with a variety of the usual clancks and apparatus.

(14,) Planing Machines

Six planing machines are to be found in the collection, amongst which, of course, those of the largest size are not sent, on account of their bulk and weight, and because their arrangements are the same as those of the medium size, of which excellent specimens are exhibited by Messrs. SHARP (204, p. 291), PARR and Co. (213, p. 292), and NHARP (204, p. 291), PARE and CO. (210, p. 292), Bid Messrs. Wittiwoath (201, pp. 287-290), the latter-sending two, of which one is provided with his revolving revers-ing tool, which cambles the machine to plane both ways. The varieties of construction by which these admirable machines are individually distinguished, although they are perfectly similar in general form and purpose, afford the most interesting studies for the engineer and the most interesting studies for the engineer said mechanist. This remark may be applied with equal force to the slotting and shaping engines about to he described, and indeed to many other groups of machines in the present collection. Mears, WrittwoAvin also send a small planing machine (two feet kin these long) moved by a crank, arranged to give a slow cotting action and a quick return; and Mr. SHANKS (210) a diminutive handmachine for the use of opticions

(15.) Slotting Machines.

Of slotting and paring machines we find one large specimen from Messrs, Shaare (20-4, p. 291), and two smaller ones by Messrs, Wattrooxtri, (201, p. 292). 297-290). One of the latter is provided with a complex bed for sustaining the work, composed of four rectiliners ildee, and one rotating disk, by means of which any form composed of a combination of executive riveular ares, and straight lines, may be pared and finished upon the

(16.) Shapino Machines.

The shoping machine, as it is called, is a kind of planing machine in which the tool is attached by pro slides and holders to the end of a horizontal bar, to which a reciprocating motion for cutting is communicated in the direction of its length, by a crank or excentric. The work is either pared to a nonmontal tube with longitudinal and vertical adjustments, or to an proour, and the machine is employed for shaping levers and cranks or curved and plane forms in general, and as it is susceptible of many varieties of construction and detail; the six specimens which are here exhibited by several leading engineers will be compared with great interest by mechanists. The largest is contributed by Messrs, Pans (213, p. 292), in which the tool has a stroke of twelve inches and the led is seven feet long; two lesser ones are sent by Messrs, Smith, Beacock, & Co. (230, p. 295), and one by Messrs, Whitwoath (201, pr. 287-290). Messrs, Smarp (p. 291) exhibit one of a very neat and compact arrangement, but not possessing all the capa-bilities of those just mentioned, and there is also one sent by Mr. SHANES (210, p. 292).

(17.) Drilling and Boring Machines

There are six drilling machines of various sizes and capabilities; amongst them Mesors. Whittwarm again appear, as the exhibitors of a large radial drill, the framing of which may be selected as an admirable specimen of casting in iron. The arm of this machine the selected as an admirable specimen of the bounds as a selected as Meson Union of the selected as the selected as an admirable specimen of the bounds as a selected as the selected as an admirable specimen of the selected as the sel is moveable through an are of 190°. Messra. (218, pp. 292, 293) contribute a large radial drilling machine, the pillar of which is formed into a serew that allows the arm to be turned completely round, and raised to any required altitude.

Excellent self-neting vertical drilling and boring machines, with various arrangements of the table, are exhibited by Messes, Whitworth (201), Shith & Co. (230, p. 293), Para & Co. (213, p. 292), and Williams (234, p. 294).

(18.) Other Machine Tools for Metals.

The remaining specimens of machine tools may be cummerated as follows :-

Engines for wheel-cutting and dividing by Messrs, Engines for wheel-cutting and dividing ny nessrs. WHITWOATE (19), pp. 257-29), and LAWIS mad Soos (2019, p. 2972); a small machine for forming circular cutters by Mestrs, SHITH (220), p. 2501; both-serve imparables by Mestrs, WHITWOATH (201), GLASCOW (219, p. 299), and SOAMSK (210, p. 292); a both-lead and nut-shaping my-line, with two machines for punching and shearing, by Mestrs. WHITWOATH (201, 40 apps).

From the above description of engineers' tools, it will be seen that Mr. Warrworru has contributed one or more specimens of first-rate excellence under each head, In addition it is necessary to direct particular attention to his measuring machine (which, however, properly belongs to the Class of Philosophical Instruments), and to the admirable collection of apparatus, by the employment of which a uniformity of system in the dimensions and fitting of machinery, and in the sizes and arrangements of screw-threads, is rendered practicable amongst engineers in general. The confusion and delay occaengineers in general. The confusion and delay occa-sioned in the repair of machinery and apparatus of all kinds by the want of such a system have long been felt; and the attention of engineers was directed to the subject by a paper communicated to the Institution of Civi Engineers in 1841, by Mr. Whitworth, Ilis system hon already obtained great extension, and he has contributed to the present Exhibition a complete set of the apparatus required to carry it out. This includes different sizes of guide-stocks, and the several dies, taps, &c., for producing the corresponding screws which he has selected as the standard forms of his system, and also sets of standard gauges, by the ose of which corresponding parta of machines may be prepared separately, with sufficient accuracy to fit without trial. He alto exhibits specimens of surface-plates, prepared without grinding, according to the method described in his paper (read at the meeting of the British Association in 1840

In the American Department, Mr. Dick (79, p. 1438) exhibits a variety of powerful machines for producing pressure with small friction, by means of a peculiar com-bination of levers whose surfaces act by rolling contact, and which are formed into curves that enable them either to produce a constant or a varying pressure according to the nature of the machine. One of these is arranged to the nature of the machine. One of these is arranged to not as a boiler-plate shearing and punching machine, Mesers, Farkmarns and Soxs (200, pp. 286, 287) contribute their important and original matchine for rivetting belier-plates by pressure; and Mesers. W. J. and J. Garrowrin (2008, p. 293) an improved machine for the same parpose, in which the pressure is produced by the direct action of the piston red of n steam cylinder,

The admirable steam hammer of Messrs, NASMYTH and Co. (236, p. 295) is too well known to require any lengthenced notice in this place. It is only to be regretted that the nature of its operations forbids it to be put in action in the Exhibition. The effective and useful forging muchine of Mr. Ryder (222, p. 294) it, however, shown in motion, its action being exhibited upon rods of

In the French Department, M. Schwerner (1475, p. 1246) has placed a forging machine in which the hammer is raised and thrown up by a enm; piles of vulcanized caoutehoue are employed to diminish the shock to the cam, and also to produce a rebounding blaw.

Two large coining presses are placed in the Exhibition, the one by Messrs, Maudellay, Sons, and Field (228, 294); the other (in the Zollverein Department), by p. 294); the other (in the Zollverein Department, ...) M. Unimon (476, p. 1078). In each, the screw is dispensed with, and they may be considered as examples of the best style of design and workmanship by which their respective countries are characterized.

Mr. Noarall, of Studies (240, p. 295), maintains, in

nction, a series of the simple apparatus employed in making needles, especially those which he terms "groove-

less needles," of his own invention.

There is no ahundance of small fly-presses in the building. Mr. Mansell (502, p. 305) has one with peculiar

arrangements for catting on an even surface of steel, without injuring the tools; and in the slwiss Department M. Daaria (Switz, 41, p. 1270), exhibits a press with the surface of the surface of the surface of a highly ornamental character, and intended for the library tasks, or shop character, and intended for the library tasks, or shop character, and intended for the library tasks, or shop character, and intended for the library tasks, or shop character, and intended for the library tasks, or shop character of the library tasks, and in this character that property belong to "ornamental fermitnes," or "stationery," as their chief chain or decoration.

In the Foreign Department we may mention a highlyfuided relling, until of most scenarie weckmankfp, adapted for a sint, by M. Kuttre (Prussia, 643, p. 1089), an a excellent machine, for forming hooks and eyes, by M. Hire (France, 250, p. 1189); and three ingenious machines, of very similar construction, for making the property similar construction, for making the by M. Fast (1607, p. 1284), the other two by M. Stotza (1494, p. 1284).

(1494, p. 1248).
Messrs, R. Joursson and Baothess, of Manchester (212, p. 292), have placed in the collection a wire-drawing bench of the best construction, being the only machine for this purpose that has been forwarded.

for titls purpose usin ans oven towarden.

Mr. Fally Anarra exhibits in Class XXII., (265, p. 623)
somo machines intended for phaning, polishing, huruishing, and ornamenting sheets, bars, tubes, &c., of med.

Mesors. Vinc and Asimkan contribute, from America
(196, p. 144), n gold-benting machine.

Messes, STRWART and Co. (238, p. 225) exhibit a model of their machine for forming the moulds in which iron pipes are cast. Several excelent specimens of large pipes, that accompany the model, show the perfection which the machine imparts to the mould, and the nuchine itself would have been sent, but it was found to be too large for the haliding.

An claborate machine, for making and charging percession caps, is cabibited in the Department of the Notherlands, by Mr. Goosensa (77, p. 1116). This machine, which is worked by two men and three children, does the work (according to the inventor's statement) of twelve machines and twenty-live men required in the system countouly employed.

(19.) Machines for Working in Wood (excepting Lather.) From the above sketch it will be seen that the Exhibition presents a tolerably fair picture of the present style of English engineer tool-making for metal-work, and that very few specimens have been sent either from the Con-tinent or from America. When we turn to the machines for working in wood the case is altered. It certainly cannot be said that such unachines are not employed in England; for, from the period of setting up the Portsmouth block-machinery, such contrivances have been gradually making their way into English practice, and our saw-mills, dockyards, and similar establishments, abouted with mechanism for rawing, veneering, planing, grooving, mortising, touguing, cutting mouldings, cask-niaking, carving, and every branch of wood-work: but, from some cause or other, probably the magnitude or roughness of such mechanism, and the noise, chips, and dust it creates, only a few models have found their way into the English Department of the Exhibition; nevertheless, the wood-work of the very huilding in which theress, the woon-work of the training words to the training words was itself almost entirely wronght into form by such machines. In America, bowever, machinery for working in wood is even more largely employed than with us, and their machines find their way into workshops of a smaller churacter. The much greater value of manual labour in that country is shown by the fact, that as little work as possible is done by hand, and that more attention is paid to economy of time and labour, and to the production of rapid results with the least possible expenditure, than to great durability and finish.
Where so many natural obstacles are to be contended against by a scattered population, we must not look so much for elegance of workmanship as for boldness of de-These remarks are illustrated by a series of machines for working in wood, which, although exhibited in operation by the Dagithá importer and patences, Mr. Picsans, of Lavergood (16), 2003, nor of American erigin, and of Lavergood (16), 2003, nor of American erigin, complexed there for ten years or more. The repte of templay and designate these anadises will a teme betray formed to the complex of the complex of the complex of complexed the complexed of the complexed of the complexed familied wood word, which the medities are intended to produce. This arrives completes a most effective floorproduce. This arrives completes a most effective floorproduce and the complete and the complete and the by least of power; and power-machine for meriting, by least of power; and power-machine for meriting, popored almostine for weed-plantage, insigning, and provous driven under a control of the floor floor of making and transport of the complete floor of such as a control of the complete floor of such as a control of the complete floor of such as a floor of the complete floor of such as a floor of the complete floor of such as a floor of the complete floor of such as a floor of the complete floor of such as a floor of the complete floor of such as a floor of the complete floor of the complete floor of such as a floor of the complete floor of the complete floor of such as a floor of the complete flo

In the French Department, Mr. Sautractil. (1s-4, p. 1246) contributes a powerful planing and moulding machine, in which revolving cutters are employed, with some important improvements in their form and mode of

In the English Department, Mr. Bluce (466, p. 209), exhibits a model of the multitude by which the multitude with the multitude with the multitude with the multitude of the mul

(20). Working in Stone, Coal, Clay, Leather, &c.

Sone. Mr. HUNTIN (172. p. 27) exhibit a model of in well-known knoe-planing machine, which has been no long and effectually employed in Scotland and elsewhere. Mentr. RANDELL and SEAVERS (282) have sent several models of stone-sawing machiner, which they have in operation in quarries at Corbana, near Bath: one of the state of th

ling in the organization of a high particular the companion of the compani

a model of a machine for atone pluning.

Coal.—Two machines, with revolving cutter-wheels, intended for cutting coal, are shown by Mr. Wanno (305, p. 205), one to cut in vertical planes, the other in a horizontal plane.

normoting plane.

Glass.—Messes, Clauder and Houderton (306, p. 295)
exhibit two neat contributes for cutting and trimming
glass shades to any required height.

Leather.—In the French Department Messes, Demany

Leather,—In the French Department Messrs, Demanary (487, p. 1201) exhibit a collection of speciment of boots and shocs in which serews are employed in lieu of stitches, and some of the machines which they use for blocking boots, cutting-out soles, &c. These machines, however,

are not completely fitted up.

In the English section Mr. Mansett (502, p. 305) has a boot-blocking machine; and Mr. WAFT (304, p. 305) a kind of printing muchine, intended to print the outlines of the parts of shoes or boots upon cloth or leather, as a

guide to the entter-ont. M. SENECHAL, France (373, p. 1194), has a press for cutting-out gloves.

Clay.-The Exhibition contains twelve ur fourteen brick and tile machines of various kinds, most of which been placed in the "Agricultural Department, which is their proper location - agricultural gentlemen which is user proper extension—agreement generating being neutily qualified by practice and experience to judge of the performance of such machines. Of the few that have needentally found their way into Class VI, we may mention Mr. Brant's machines for making hollow bricks (301, p. 295), and a machine of Mesors. RANDELL and Sauxhers (324, p. 297), in which the clay is forced through the mould by the continuous action of two revolving spirals instead of the usual reciprocating

In the French Department, Messrs. Bonze BROTHERS in the French Department, Siewis, Bonte Biovrneiss, di 7, p. 1199) exhibit an excellent machine for making hollow bricks, in which the plays of the mould are supported with great skill, in such a manner as to obtain the splitting of the bricks, which, in the common construction, is apt to result from the position of the bridges by which the plags are carried.

(F.) GRINDING AND CLEANING PLOUR AND OTHER VEGETABLE PRODUCTS.

(21.) Mills for Grinding.

In the first place we may direct attention to the stones, ateel, and iron pintes, &c., by which the grain or other material is to be erashed; many specimens of these are exhibited, detached from the machinery by which they must be maintained in motion when used. Messrs. Thus and Co. (457, p. 304) exhibit French milistones made at La Ferté-sons-Janarre, and fitted with

Hanon-valck's patent acrator, for introducing fresh air between the stooes, Messrs, Hughes and Sons (459, p. 394) have also a pair of stones with channels for the introduction of air,

and Mr. CLAYTON (440) a pair of French stones. Mr. Hunwoon (414, p. 301) specimens of grinding plates in steel and cast iron formed in concentric rings. plates in steel and cast from formed in concentric rings.

In the French section, hurris-stones of different sorts and qualities are exhibited by Gaulland, Sox (228, p. 1187), Perri and Co. (345, p. 1194), Boccans (341, p. 1199), Gifferent-Bourenos and Co. (529, p. 1294), Moxer Chambort (560, p. 1299), Bools (1448, p. 1245)

Thiaact? Bouleave (1502, p. 1284), Totalland (1508, p. 1245) and in the Zollverin section, M. Landau (231, p. 1286), and in the Zollverin section, M. Landau (231, p. 1286). (9), stones of lava quarried near the Moselle. p.

Mills, fitted up for grinding grain, ores, &c., are shown under the following oumbers: - Mesors, Fahirann (403, p. 298) a corn-mill on a cast-irou frame with gearing: showing their improvements in the modes of driving, adjusting, and feeding the mill-stones.

Messrs, Concorns and Co. (416, p. 301) a portable corn-mill with French burr-stones, intended for the use of emigrants; and Messrs, Tootal (446) a small hand-

Mr. Boucnon (France, 431, p. 1193) also exhibits a small mill complete with bolting machine, for entigrants. Messrs, Westrup and Co. (442, p. 303) a mill of a peculiar and compact arrangement, consisting of two pairs of conical stones, one above the other, but attached to the same spindle; between them is a conical wire sieve, with brushes fixed to the spindle, by which the fine flour detached by the upper stones is separated from the grain before the coarser parts fall to the lower In the American section, Mr. Ross (213, p. 1450), a

model of a portable mill.

Messes, Messes and Cantier (France, 635, p. 1208)

stone is the runner, and there is an arrangement for the

introduction of ntmospheric air between the stones.

In the Belgian section M. Houver (125, p. 1155), and
M. Deskaune (131, p. 1155), exhibit each a model of a small mill, with a ventilator to drive atmospheric air between the grinding surfaces.

A little machine to cuable a workman to cut and A true macronic to contain a workman to cell mag sharpen mill-stones with great precision, and without danger to his eyes from chips, is exhibited in the English section by Mr. Passons (Class V. 642, p. 247); and in the French section a similar contrivance by M.

Touaillon (1508, p. 1248). Mr. Chosaetha. (404, pp. 298, 299), Mr. Henwood (414, p. 301), and Messrs. S. and C. Adams (429, p. 302) have exhibited a variety of mills fitted with metal plates for grinding wheat and other vegetable substances, hours, minerals, &c.

Coffee-mills are shown by W. Murk (206, pp. 291, 292), FIREDROPSE and Co. (443, p. 303), SAVAGE (458, p. 304), and VANDENBROUGE (France, 711, p. 1230). A hand-some silver apparatus for toasting coffee is exhibited by Messrs. Dakin and Co. (408, pp. 299, 300)

In the French section M. HERMANN (873, p. 1221) has fitted up a complete and admirable set of machines largely employed for the manufacture of chocolate, by which the cocoa beans are emished after being roasted, mixed with sugar, and the chocolate fully prepared fur-use. Also an apparatus for mixing and grinding grees, matters for perfumes, scaps, &c. A mixing machine for chocolate is also exhibited by Messes, GATTI and BOLLA (450, p. 303); and a set of excellent machinery for erushing and grinding potatoes, and for making potato flour by a cylinder with saw blades, by M. Hick (France, 541, p. 1204).

(22). Machines for Cleaning and Separating the Products. We will now proceed to enumerate the machines for cleaning grain and separating the finer particles from the coarser after grinding, for which a variety of arrangements are shown, differing in the position of the revolving sieves, in the material and disposition of the brushes and besters, and in other particulars, Mr. HUNT (422, p. 301), vertical flour-dressing machine,

with bair brushes. Mr. Bedfrong (426, p. 302), inclined wire cylinder, with external revolving hair brushes. Mr. BLACKMURE (428, p. 302), model of a bolting

machine, having cloths without seams and revolving gutta percha flaps outside for cleaning the cloth. Mr. SPILLER (436, p. 302), flour-dressing machine; Mr. SHORE (438, p. 302), flour-dressing machine, with cylindrical wire sieves, having revolving wings inside, with steel plates in lieu of brushes; Messrs, Cooms and Co. (444, p. 303), models of inclined and vertical cleaning as small machine for elessing currents, with whalebono brushes; Measures, Williams, with whalebono brushes; Measures, B. and E. Millangton (462, p. 305), n cleaning, or smut machine, with revolving wire brushes; Messrs. R. and J. Rankin (466, p. 305), a vertical smut machine, having an exhauster above to remove the dust;

and, finally, Mr. Asust (470, p. 305), an apright flourdressing machine. In the French section, machines are exhibited by M. In the French section, machines are extinuted by at, Ilcx (541, p-1204), for extracting and separating flour from ground postoles; Mesers, Vacinov and Co. (705, p-1212), for leading grain; and M. Historicart (1866, p. 1237), for botting floor,—having a silk cover, and accompanied by various excellent specimens of sidk gauze for bolting.

In the Belgian section we find machines for cleaning and glasting rice, by M. Hinutar (125, p. 1155); and a cylindrical machine for eleaning grain, by M. DANNEAU (507, p. 1167).
Under the present head may be mentioned a set of

effective unchines by Messra Harrary and Co., of Reading (410, p. 301), for manufacturing bisents. In the French section an elegant machine for heading dough by means of a rovelving spiral, by M. Bolann (428, p. exhibit a small portable mill complete, in which the lower 1100). A model of a machine for making hiscuit

their labours, Other machines, for similar purposes with the above, are placed in the class of Agricultural Implements, and have therefore not been submitted to our inspection. Indeed, it may fairly be questioned whether the greater part of those piready enumerated might not have been

also placed in Class IX. with advantage, (G). MANUFACTURE OF SUGAR.

The sugar-cone mill of Messrs, Roppssons and Russell, (418, p. 301), a magnificent specimen of mill-work on the largest scale, with horizontal cylinders, is shown in partial action, Messra Colling and Co. (432, p. 302) bo exhibit a horizontal sugar mill, and Messrs. Granay, WEST and Co. (445, p. 303) several beautifully con-structed models of different forms of sugar mills, &c.

Three superb sets of vacuum apparatus, for the munufacture of sugar, are exhibited; each from a different country, and each remarkable for magnitude, perfection of workmanship, and excellence of arrangement, as well as for peculiarities characteristic of the nations that have produced them. The English machine of Messrs, Poxylyrx and Woop (602, p. 305) is of great manufacturing power; and its enormous donce, formed from n single piece of copper, is a very winderful speci-men of the coppersmith's art. The French machine, by Mesers. Cata and Co. (1557, p. 1251), is similar in its general form and magnitude, of admirable workmanship, and considered by French practical chemists to be even superior in its arrangements to that of Messrs. PONTIFEX. The muchine of M. HECKMANN (Pressin, 52, p. 1030, and see 'Illustrated' 1051), although not equal in magnitude, nor perhaps in workmanship, to the two already mentioned, must be regarded as a contribution of first-rate merit.

The bydro-extractor or revolving machine, by which water is driven out of goods by centrifugal force, was inwater as surves out or goost by centrifugal store, was in-sected by Mr. Streets many years since, and in great; writed by Mr. Streets many years since, and in great; writed by Mr. Streets many years since, and is great; the streets of the street

of merit, of which we may mention those of the original inventors and proprietors, Meass, Markove, Alliott, and Savara (45t, pp. 503, 304); n well-made machine by Mr. Bissemen (400, pp. 297, 228); and one by Messrs. Rorch and Fixer (405, p. 299). In the French Department, one by Messrs. Berauter and Co. (425, p. 1199); and in the Belgian, one by Mr. VANGORTHEM (124, p.1155).

(II). APPARATUS FOR PREWING, DISTILLING, AND MANU-

FACTURING CHEMISTRY. Mr. Lawaence's distributar (604, p. 305) has the advantage of an equal distribution of heat throughout the wash, either by steam or water, and facility of cleaning the false bottom. He also exhibits a good refrigerator and a store cask, for preserving beer in store, and pre-venting accidents in bursting. Mr. Tizzani (530, p. 307) has a model of a brewery, exhibiting several novel and useful arrangements of the backs, mash tun, refrigeand useful arrangements of the bucks, mash tun, refrige-rator, fermenting and cleaning tuns, and employing steam for beating the liquor back, &c. Mr. WHIKLEN'S refrigerator, exhibited by Mr. Ilclus (618, p. 307), its said to be very rapid in its action, Refrigerators are also sent by Messrr. Askrw (611, p. 307), Copyry (615, p. 307), and Thombox, Youngar and Co. (628, p. 307). Carbonating or acrating machines, for making sods water, Seltzer water, &c., are exhibited by Messrs, Coxe. (608, p. 307), in which pumps may be employed to ex-haust the atmospheric air from the water, previously to carbonizing it, or to force the carbonic gas into the water, when so deprived of the common air. Other machines are exhibited by Messrs, Tviers and Co. (605, p. 306), and hy Messrs. Cooper and Bussile (624, p. 307).

Of apparatus for other chemical manufactores we may direct particular attention to Bounna's colour extractor (610, p. 307); Dawson's new distillers' and rectifiers cord, p. 307); DAWSON a new distincts and recitizers recording close safe (612, p. 307), for the Excise; Hallipat's apparatus for the manufacture of pyroligneous neid (617, p. 307); and Hill, Evan, and Co's, patent

CLASS VII.

CIVIL ENGINEERING, ARCHITECTURE, AND BUILDING CONTRIVANCES.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in tha OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.

Jury.

I. K. Burva, F. Ris, Calarma and Byrater, Date Surses, Westminster, Cvil. Engineer, Canasan Conara, Pringer Galarma, Brance Member of Battists and of Cestal Departs. Dr. Nata, Answery, P. R.S., Bettlerd Sparary, Boctor of Medicine. of Sugitation of Control of Cont

of mechanics, as well as the proper application of raw materials to the various purposes of construction; and architecture, especially, includes, besides these, design in sculpture, modelling, and colour. When each of these different branches of science and of art is classed under a separate head, and the objects which illustrate any of them are removed to their separate classes, there can remain but little belonging exclusively to architecture or civil engineering. As might have been anticipated, therefore, the objects comprised in the Official Catalogue under Class VII. are not numerous, and generally speaking, are not important, although the classification of "Huilding Contrivances," under this head, has admitted n very great variety, including many details of construction, of every degree of importance, from the bolt of a garden-gate, and the apparatus for sweeping of chimacys, to the construction of lighthouses and the means of

moving large ships. Another circumstance has tended, also, very much to limit the extent and the importance of the contributions to this class. The works of the architect and engineer can, generally speaking, be exhibited only by drawings or models, and consequently, with few exceptions, it is the model, and not the work it represents, which has been brought before no; and the modeller, more frequently than the architect or engineer, is the exhibitor, From these causes the inbonrs of the Jury have been comparatively light, and might have been somewhat de-void of interest but for the circumstance of two remarkable objects, one of them not included in the Cutalogue, having been brought under their consideration anbsequest to the commencement of their proceediags, viz., the great building in which the Exhibition is placed, and the model dwelling-houses (pp. 111, 112) which are erected near it. With respect to the first, it has been so pre-eminently successful in every respect, and by uni-versal consent reflects such credit upon all concerned in its design and in its execution, that it is left to this Jury only to be the formal agents of recommending to the Council the awarding of the highest prize, the Council Medal, to Mr. Joseph Paxton, who originated the design, and to Messrs. Fox, Hennerson, and Co., who most ably carried it into execution.

As regards Mr. Paxton's claim, amidst the competition

of the whole of Europe, he proposed that mode and form of construction of hullding which appeared on first sight, and which has since proved to be, the hest adapted in every respect for the purpose for which it was intended. The design possessed this peculiar merit of fitness for its object in a singular degree—there was no startling no-velty in any one point which could lead astray the judgment of those who had to determine upon the choice of plan, or which could in the first instance obtain, still less permanently secure, the good opinion of the public. As Medal.

THE works of the civil engineer and architect embrace, regards the form of outline, which is most simple, several generally, combinations of many branches of the science | designs nearly resembling it had been submitted in the general competition. As to the materials, several pro-posals had been previously made to cover the whole area to be inclosed with glass, and iron would, of necessity, be employed for the framing. But in the combination of form and materials, in the particular mode of applying those materials, and is the adaptation of the forms to be selected to their convenient use, as well as in the various details by which the whole was rendered perfect, the design was entirely distinct in character from all that had been proposed, and appeared at once to have the one single merit of being exactly that which was required for the purposes in view. The design, as realized, has com-pletely fulfilled every condition of utility. It has equally proved to be capable, by simple but judicious decoration, proved to be capance, ny stuppe not pacteous decoration, for which we are indefined to Mr. Owen Joues, of being rendered most elegant and brilliumt in effect; and although very novel in its construction, it has been found, from the ingennity and mechanical fitness with which all the details have been carried into execution, to be susceptible of rapid and moderately economical

To Mr. Joseph Paxton, to whom the merit of this design is due, the Jury have recommended, and the Council have adopted the recommendation, the award of the Council Medal.

By n fortunate coincidence the execution of the design thus ally conceived was undertaken by parties peculiarly well fitted to do it justice. Considerable experience and skill were required in every detail of mechanical construction, great method in carrying out to the fullest extent a system of repetition of similar parts, and strict habits of business and of order, for organizing a system by which vast quantities of materials or of manufactured by which wast quantities of materials or of manufactured parts could be obtained with certainty from several quan-ters, and large bodies of workmen kept regularly em-ployed in the rapid application of these materials and the parting together of the parts. There was also re-quired a command of an extensive extabilishment, and of a staff of able assistants and superintendents. All these requisites and conditions were necessary, and in a high degree, for the purposes of rapidly determining upon all the details of construction, preparing all the working drawings, insuring the construction of the numerous parts in large quantities, and ready to be fixed with perfeet accuracy in their reveral places; and lastly, in excepting without any delay or accident, resulting from miscalculation or error of construction, or defective arrangements, a work of unusual magnitude in an unarrangements, a work of time. All these conditions and qualifications for success, and in the requisite degree, were found combined in the persons and in the establishment of the contractors, Messrs. Fox, Henderson, and Ch. To them accordingly the Jury also recommended a Council

Strongly contrasted with this huilding in its magnitude and in every one of its principal features, and in all its estemble objects and uses, stands the Model Dwelling-house. But though contrasting in pretension, it is in importance second neither to the building itself, or to anything within the Exhibition. And in respect to the number of those whom it seeks to benefit, and the exteat among or copy wount i seems to benefit, that the extest to which their physical and morn! condition may be ameliorated, and the amonot of additional comfort and happiness to be created by the simple means thus suggested of improving the dwelling of the working man, no other in the Exhibition states to be extented to the state of object in the Exhibition yields to it in value, or suggests more weighty considerations for the political economist

and the philanthropist. To place within the reach of all a large proportion of those comforts most conducive to health, to habits of elenaliness and decency, which have hitherto been enelemanaces and uncreasy, where nave intreasses or enjoyed as laxuries only by the few; to remove that painful necessity under which the poor man now labours of aubmitting to privatious and inconveniences, which are destructive of moral labbis and utterly inconsistent with domestic comfort, and to place at his command a certain degree simost of luxnry, which tends to refine the mind, and substitutes a comfortable home for a miscrable and harely efficient shelter from the elements, is the am-bitions but wise and benevolent design of those who, with the example and under the leadership of HIS ROYAL HIGHNESS PRINCE ALBERT, have of late actively promoted the improvement of the dwellings of the working

Separate dwellings for a few families, and many large lodging-houses have been built at the expense of private associations and individuals, as sperimens of what is desimble, and examples of what may be done. These examples have already produced a marked effect upon the demands of the teaant, and upon those who bave to sup-ply the demand. But in order to secure permanently and sufficiently these beachits to the million, for whom they are intended, they must be provided at a price which the occupier can afford to pay, and which shall at the same time judget the builder to erect the houses. This has been the principal difficulty, and one which Mr. Roberts, the architect, who designed the bouses now flowers, the areanees, was transport in source con-nuder consideration, has long laboured to overcome. The present example has been erected under the direction and at the expense of His Royal Highness, and contains all the latest improvements of general arrangement, material, and workmanship. It is fuir to assume that in a new branch of industry such as this, great improve-ments may be made; and if so, we may hope in a very short time that the houses of the labouring classes may excel in elevaliness, equality of temperature, and perfect ventilation, the best houses now constructed for the wealthier classes.

In the houses exhibited, accommodation is afforded for a sufficient number of separate sleeping-rooms for average families. By the use of hollow bricks the walls are made to be less perfect conductors of heat and sound; and the rouses are more economically heated, and are rendered more equable in temperature. By the use of brick and stucco floors, and glazed bricks in the side walls, the whole building is rendered fire-proof, and the walls and floors cannot harbour inseets, and may be kept perfectly clean at the smallest possible expenditure of time and trouble. The hollow bricks are used for airpassages in the euroices and around the upper part of the room and communicating with the chimney, in the manner practised by Dr. Arnott, and thus excellent ventilation is easily obtained. A supply of water is provided upon each floor; and the whole is stated to have been constructed at an expense which allows a set of rooms, capable of affording a really comfortable home, being let ut as low a rate as is now paid for the wretched lodgings from which the poor man escapes to the street ur the public-house, and to which he cannot return without disgost

It is difficult to over-estimate the magnitude and imsortance of the effects of such a change upon the popula-ion of the country, whether as adding to their individual lappiness, or improving their physical and moral condi-

tion, and thus rendering them more valuable and useful

mbers of society.

The Jury have unminously recommended to the Council that they should award the Medal reserved to their gift to His Royal Highaess Prince Albert, as the exhibitor of this most useful and interesting contribution to the Exhibition, and to whom the nation at large is so deeply indebted for the promotion of this important

The views of the Jury upon the merits of the two important objects for which they have recommended the Conneil Medal, have been stated at some length; but it will be desirable, in order to avoid any invidious distinction, to refer more generally and less in detail to those contributions for which after the approval of the Council, it is proposed to uward the Prize Medal. The order in which they will be mentioned must not be considered as indicating an attempt to classify them according to their respective merits, but as resulting from a pre-arranged classification, according to the circumstances under which the objects might be supposed to be sent. Thus models of works executed, and which were contributed by the designer and executor, and as explanatory of the design, and not as a specimen of workmanship in the model, are classed before models contributed by the modeller or by others than the authors of the works, or which are distinguished principally by perfection in the art of modelling, and both as connected more or less directly with the construction of important works in architecture and civil engineering, have been mentioned before amongst " Building Contrivances

Amongst the limited number of models of works successfully executed, entributed by the nutbors of the ori-ginal works, and explanatory of their designs, that which ginal works, and explanatory of their designs, that which happens to fulfil most completely all the conditions of the proposed elassification, is one which also well deserves mention for its merit. It is the model of the dome of the Observatory of Paris, constructed by M. P. L. Thavens, of Paris (1044, p. 1228). The difficulties to be overcome in this work were serious. It was desired to establish on the top of nn existing eylindrical wall of masoury, of about 40 feet in diameter, and having no sufficiently solid central support, a steady centre for an equatorial of large dimensions, and a revolving floor and done of the diameter above stated, the motion of which Travers has for this purpose fixed the instrument upon a small control floor, resting on a conical framework of strong iron ribs radiating from the centre and fixed into the inner surface of the cylindrical wall: a second series of radiating ribs also fixed to the wall and placed intermediately to the former, carries a ring conce small floor, and which serves as the centre of motion for the revolving floor and building. The building, with its done and floor 40 feet in diameter, and weighing about 40 tons, revolves round the central guiding circle before mentioned, and apon a series of rollers working upon a ring hedded upon the wall. The attempt was a bold one: the design rhows south mechanical knowledge and skill in construction: the model illustrates the design clearly, and the result of the attempt is said to have been

eminently succe-sful. Mr. Thavens (p. 1228) also exhibits a model of an ex-cellent iron roof of 120 feet span, constructed by him for the Custom house, Paris,

the Castom house, Paris,

Captain Sir Santra, Brown, R.N. (No. 331, pp. 531,

532), exhibits models of slips for building-up slups, as
designed by himself, and which have for many years
been successfully employed; also nanicrous models of
works which he has executed, and of projects for various
contrivances connected with the construction and moving

of ships. Mesors, S. and H. Mostrox (24, p. 311), have exhibited a model of the patent slip which has so long borne their

Of the models exhibited under circumstances approach jug nearest to the condition above named, are the models railway drawbridges, constructed upon the Datch railways, and seat by the Emiluay Company, by whose engireer they were designed and executed, and-

The model of the Britannia Hridge, contributed by Mr. E. CLARKE (107, p. 341), a gentleman engaged in its construction, and whose name is closely identified with the work as the principal assistant to whom the in-vestigation of many of the scientific questions involved in its construction, and the superintendence of the work, were intrusted. Of the first named, the works have been executed some years, and have well answered the pur-poses for which they were intended. The peculiar mode of opening the bridges is well worthy the study of the engineer, and the application of the principles on which they are constructed may prove highly useful. The models are perfectly well made. Of the Britannin Bridge It is namecessary to do more than to name it. It is naiversally recognised as one of the finest works of the age; but the object bere exhibited can be considered only as a model of the work, and is classed accordingly. In workmanship it manifests the perfection of the art of modelling, and reflects great credit upon Mr. J. James, who is stated in the Catalogue to have executed it. Under very similar circumstances may be classed an

cerelieaty executed model of that great work, the Plymouth hreakwater, contributed by Mr. W. Straat (28, pp. 311, 312), who has personally superintended the execution of the whole of these works, from the counteness.

ment in 1810, To the exhibitors of the two models adjoining that of

the Britannia Bridge, Medals have also been awarded. That of the Kief Suspension Bridge is contributed by the engineer, Mr. C. Vicisorus (105, p. 321); but the work is not executed, and therefore, although in course of construction, can be considered only as a design. The model is by the same workings as that of the Britannia Bridge, Mr. J. Janes, and is a most claborate and beau-tiful piece of work, exhibiting every minute detail. The model of the bridge erecting over the Wye at

Chepstow, is exhibited by the contractors for the work, Messrs, Freen and Willer (9, p. 310). It illustrates well the construction of the bridge, but is not highly

finished.

In the American Division there is a full-sized model, or rather a portion of a bridge, illustrative of the principle of construction on which several large bridges have been erected in America. The principle is a modification of the "lattice bridge," in which iron is skilfally introduced. The design, which is by the Messrs. Ilidea, exhibits that ingenuity and skill in construction for which the Americans are celebrated. It is sent by the

which the Americans are construct. It is sent by the New Yung Loos Bandoe Company (147, p. 1416). Prize Medals have been awarded to Mr. Saltzer (p. 85) as the exhibitor of several most beautiful models of engineering and architectural works, and to Mr. J. W. LEENAN (257, p. 1282), who bus exhibited a very heau-tiful model of the Cathedral of Strasbourg; and of Mr. G. MICHEL, of Berne (248, p. 1282), for an exquisite model of a Bernese farm-yard, with every detail both of interior and exterior, the Jury make Honourable Mention.

and exterior, the Jury mass from the state of the State of Wight, a most perfect specimen is exhibited by Captain Innerson (p. 851), being the model of the Undereliff, life of Wight, from a trigonometrical survey, with every detail minutely and accurately given.
Mr. F. A. Cannington also exhibits several excellent

models of various parts of England.

Before mentioning designs for mechanical construction not yet executed, it will be right to notice Mr. W. C. Wilkins' revolving floating-light (157, pp. 326-328), in which excellence of workmanship is combined with judicious contrivances for meeting the various difficulties of ctons contrivances to meeting the annual light, attached to the mast of a floating-light vessel. These lights are to the mast of a floating-light vessel, in use and work well.

The designs for novel construction in engineering are not numerous. Of these two have been selected as worthy of a Prize Medal, the breakwater and lighthouse of Mr. W. H. Sattu (165, p. 328), and a bridge by Mr. J. T. Rose, of Leith (180, p. 329), in which an elegant and mechanical arrangement of timber is suggested.

Westminster, October 1851,

Amongst building contrivances it is to be regretted that more numerous examples of heating and ventilating have not been found. But these having been generally connected with branches of manufacture, are considered in other Classes. Of the contrivances more or less connected with building, which have remained in Class VII., Major PRATT (16, p. 311) has exhibited a model of a very major rearr (10, p. 011) and cambine are simple and ingenious system of steps, for landing from boats, which rise and fall with the tide, keeping at all times a complete set of steps, with a vertical rise and trend, and with a landing at the bottom, and the parts, being never covered by the water, may remain clean and The model is small and unpretending, but the object dry. The motor is same and unpretending, out the object is by no means unimportant, and the idea promises to be successful and inexpensive in construction. No greater merit can be ascribed to any plan, and the Jury have considered it well worthy of a Prize Medal.

To both Mr. C. E. HEINER (53, p. 315) and Mr. A. Siene (1, p. 309) the Jury have awarded Prize Medals for complete sets of diving-dress upparatus, alike excellent in construction and well studied in detail; each has some peculiarities, but both are good in workmanship and well

signed.

In contrivances for more domestic purposes to Messrs. J. HENNETT and Co. (152, p. 526), who have exhibited a specimen of their metal slintters, and several excellent water-closets; and to Mr. T. H. Wilson (113, p. 528) for a very ingenious contrivance for a bolt for double roadgates, which gets rid of the objectionable stop that is now used, which, rising in the middle of the road, is both dangerons for horses and very unsightly, and for a system of bolts and slides for doors, which renders them almost air-tight, and adds to their scenrity against violence, the Jury have also awarded Prize Medals,

Amongst several objects which were allotted at a late period to Class VII., the Jury wish tu draw particular attention to wo sets of boring-teels from the Continent, one contributed by Mr. J. F. Lauk, of Wilders, Switzerland (65, p. 1270), constructed on a principle that has been eminently successful, in which water is introduced by means of bollow rods, and mixing with the powder or small dust formed in the boring, is discharged through the tool by the blow of the latter, in descending or by other means, and thus carries with it the produce of the other means, and this curries with a time produce a boring, keeping the bottom clear and fresh to receive the full effect of the tool. A boring of 1,300 feet in depth has been made with these tools, and with a facility of

which the old tools are not susceptible. Mesers, MeLor and Sos, of Paris (638, p. 1209), have also exhibited a set of powerfol buring-tools, similar to those with which they effected the celebrated "Puit Ar-tésien," of Grenelle, which exceeds 1,800 feet in depth. This result is sufficient proof of the excellence of the apparatus,

Among contributors of other objects, worthy of Ho-nourable Mention, but to which prizes have not been awarded, the Jury desire to record the names of—

awarded, the sury desire to record the names of—
Mr. T. Borch (73, p. 317), the exhibitor of a model of
a milway ferry-boat.
Mesors, Barmera and Soxa (95, p. 318) for their models of various apparatus for working in situations exposed to

the sea, and of that used to assist in getting off the "Great Britain" steem-ship.

Mr. J. Donsox (114, p. 323), for his model of a fine roof

at the Newcastle Railway Stat Mr. G. Hunwood (31, pp. 312, 313) for a simple appa-

ratus for shutting and securing ships lights.
Mr. J. Leemann (258, p. 1283) for a model of a four-tain in the Market-place of Nuremberg, by the Sculptor Schald Schouhofer. (Honourable Mention in Class XXX, ALICE LOWE and Co. (62, p. 316) for stink-traps

Mr. T. G. Newsman (170, p. 328) for models of orna-mental roofs for churches and other similar buildings, of terra cotta, and also of timber, and for a construction of window-sashes, showing much ingentity From Saxony some excellent models of roofs have also

been scut, which deserve mention.

PART I.

NAVAL ARCHITECTURE, It is not unworthy of remark, as being a singular feature in the maritime history of Great Britain, that whilst, during a period of war, vast improvements were being made in its military service, very little was effected for its navy until after the Trenty of Peace.

It was not until a general pacification in 1814 had freed Europe from a severe and terrible military strug-le, that Sir Robert Seppings, then Surveyor of the Navy, brought forward his improved method of navai construction. The lower parts of the frames of ships of war were then for the first time filled in, and no longer afforded interstices for the accumulation of dirt and putrid water; and the frame-timbers of the bottom presented a compact mass of wood from the keel up to about the light water-line. Besides this great improvement, the whole fabric was further strengthened by means of a system of diagonal trusting, which, together with the solid bottom, opposed such resistance to the forces due to the weight of the hall and its contents acting downward, and to the furces due to the displacement or pressure of the water acting ppward, as effectually to prevent the keel from shorteolog, and consequently the ship from hogging or breaking down in the direction of her leugth, as it was liable todo formerly, or otherwise yielding to the forces of pressure under sail, or those of pitching and rolling in a tempestuous sea.

In addition to these first great steps in the progress of ship-huilding, the upper parts of meo-of-war were much improved in form and strength; the stern, instead of remaining open to the fire of an enemy, has been more atrongly built, in a senicircular or rather elliptical shape, better fitted for defence in every direction. The upper decks have also been enlarged, and space gained for working the guns, The building of ships of war has been further improved

in many ways which cannot be explained here. More solidity has been obtained by greater precision in joining

* This Report was written in English by Beron Dupiu.

the various masses of wood constituting the ship. By such means the working of the timbers in a heavy sea is greatly prevented; and both solidity and greater dura-bility are obtained.

Instead of firing the great guns by the same me-chaoism as old muskets, caps and hammers have been adapted to them

Advantages of still higher importance have been obtained by the introduction of guns of very large calibre, mainly due to General Paixhans, which were introduced nearly twenty years ago, and called casons à la Paixhans. At first very few such guns were placed in each ship; but now we find complete batteries of 68-pounders, the effect

of which cannot fail to be tremendous The combination of large masts has been rendered more economical, easy, and solid, by the employment of coaks ur cylinders of hard wood, inserted oue-half of their length into each of the pieces of the mosts, brought

Sir W. Symonds, who succeeded Sir Robert Seppings in 1832, as Surveyor of the Navy, turned his attention toward an improved form for ships of war, and designed them of such figure and dimensions as to require very them of such figure and dimensions as to require very little ballast; this he in great measure accomplished by a considerable increase of the breadth. This system hall many advantages; it gave greater stability, and in sharp ships more space below fur stowage, besides a larger field or deck for working the guns; and although many talented naval constructors and officers considered this form unfavourable to an easy motion at sea, and liable to distress the spars; we have, nevertheless, great came to be thankful to this talented and meritorious officer for his laudable and unwearied endeavours to improve the con-

We are further indebted to Mr. J. Scott Russell, the distinguished Secretary of the Royal Commission, for a series of valuable experiments and researches on the form of least resistance at high velocity; this form being determined by examining the form of waves pro-

duced hy drawing vessels through a cutal at different degrees of speed. Further experiments are being made hy this gentleman in the application of his deductions to sea-going ships, and he has our best wishes for their ultimate success.

The theory of stability, so important to the navy, and which we considered in a geometrical point of view, has been examined, both successfully and ingeniously by the Rev. II. Moseley, the President of Jury V. The stoware of shins has been much improved, of late

years, both in the form and disposal of stores; thus water-casks are replaced, at the suggestion of General Bentham, by iron tanks. The cube or primatic form of these task issues are great economy of space as commercially the support of the contract of the contract of the contract of the contract, have the soluble part of their wood dissolved by the water, causing patriffly, which produces various diseases, especially in hot elimitate.

Equally important with the improvements in keeping water free from taint, must be considered he mades invented by M. Appert for preserving all kinds of useat. The preservation of gunpowher free from hamidity, so necessary for ships of war, is now rendered perfect by the employment of hermsteinly sealed metallic eases, or wood cases with metallic lining; an improvement due to the British number.

In the French mary, great improvements have been made by separating passages for the conveyance of cartridges from the magazine up to the various batteries of the ship. These arrangements were partieularly remarked by the English during their visit to the French fleet at Cherbourg in 1850.

We now come to a series of improvements of the highest importance to the safety of ships. The hempcables formerly employed were very objectionable, being liable to rapid decay, particularly in hot climates. When the mehor was east on a rocky bottom, the cable was frequently cut by the rocks, and very often parted, so

that the ship was greatly endangered.
A captain of the British navy, (Sir Samuel Brown,) introduced enther named of iron links, so arranged as to be easily worked. These chain-cables are now in general nee, not only in ships of war, but also in the commercial shipping of every maritime nation. We shall have enough to have received the highest of our awards, as being one of the greatest effected for the shipping inte-

rests and the preservation of Ilife and property.
The first method for stopping iron cables is due to the
English; let last and best belongs to the expain of the
English; let last and best belongs to the expain of the
Present figured "Jopen". A high execution is due to the
having devised the means by which the chalic-cable can
be worked on the capstan. The various links as they
succeed seads other all into grooves, on the periphery of
a large polygonal typin forming the body of the english.
Large polygonal typin forming the body of the english cable
chalic-cable larve in succession half their thickness todged
in these grooves, and successively dislengage themselves

with mathematical precision.

The improvement in cables unturally leads us to speak of anebors.

Very remarkable improvements have been recently made by Lieut. Roucar, R.N., insuring a better distribu-

made by Lieut. Bonnan, R.N., insuring a better distribution of the metal in the direction of the greatest arrana. The palm of the suckor, instead of being flat, presents much made and the properties of the present and the consequence is, that these new anchors hold much better in the ground. The Committee of Lloyd, so competent to judge of every contrivance likely to preserve ships, have revolved to allow for the suchors of the ships they have revolved to allow for the such or of the ships they have the such as the such as the such as the such as the last the such as the such as the such as the such as the last the such as the suc

Another source of safety, most important to ships, is an efficient application of metallic conductors by which they are secured against the destructive element of lightning. Franklin made the immortal discovery of the identity of artificial electricity and that from the thundercloud, and through the instrumentality of the lightningrod, devised a happy application of his discovery to the

preservation of buildings and ships in thunder storms. he variable and complicated circumstances, however, under which ships are necessarily placed, rendered the use of such rods on ship-board difficult and apparently impossible. The masts—the only parts to which they could be well applied—consist of many distinct portions: these it is often requisite to move one upon another, and sometimes to remove altogether; they are also liable to injury from wind and other forces acting on them. The de-fence of ships from lightning had hence been confided to a small chain or rope of wire temporarily applied along the rigging; but which, from the very nature of the case, fails to afford the full amount of security to be derived from a more powerful conductor permanently fixed along the mast. Sir W. S. Haunts conceived the idea of making capacions metallic conductors an integral part of the masts and hull of the vessel, so as to ring the general fabric into that perfect conducting or non-resisting state it would assume, in respect of the nanter of lightning, supposing the whole mass to be me-tallic throughout; this be has offected by incorporating with the masts and hull a series of copper plates, so arranged as to meet all the varying conditions of the spars, and so tied together that an electrical discharge, striking upon any part of the vessel, cannot enter npon any circuit of which the conductors do not form a part, and thus the ship is preserved from the effects of ning at all times and under all circumstances, without the officers and crew being in any way concerned in the Sir W. S. Harris has shown, by original researches in science, that in whatever position the sliding musts may be placed, a line or lines of conductors pass through the ship to the sea, affording less resistance to the passage of the electrical discharge, than any other arrangement which can be devised. The most perfect security is derived from the plan thus introduced. Sir Baldwin Walker, one of our fellow jurors, has himself experienced the great advantages of this system in a large frigate commanded by him, which was struck, both on the fore and main-masts, by heavy discharges of lightning on the coast of Mexico. In this case, the force of the discharge was such as to partially fuse the metallic point aloft on which the lightning struck, and leave spots of fusion on the surface of the conducting plates, hat without the least damage being done to the spars or hull; and this, too, while the top-gallant-masts were We have given our highest award to this, which we

We have given our highest award to this, which we consider as the hest apparatus for the preservation of ships against the terrible effects of lightning.

Another source of safety in the construction of ships is the substitution of two fire wood. In a century like the substitution of two fire wood. In a century like the substitution of two fire woods. In century like the substitution of the substit

binding of ships of war. The riging, blocks, and mile of ships have been im-The riging, blocks, and mile of ships have been imtered by the ships of the ships of the ships of the construction of blocks is managed with remarkable noney since the invention of the salinishle block machinery by the late Sir J. lambard Brunel, in his youth a French naval offser. We have awarded Prize Medals to lapporements in the countraction of large blocks as tunied excooning in material and as better fitting of their united excooning in material and as better fitting of their hooks and rigging. Rope-making is likewise improved, We owe to British ingenoity the obtaining of equal ten-sion amongst the threads of which the largest ropes and cables are now made, and the operation of laying the ropes, by mechanical power, with mathematical precision.

The commercial marine of France exhibit cordage made in this manner, which is certainly much better than any shown on the English side of the Exhibition. Both countries have improved the texture of their sail-cloths, as will be seen by the Report of the Jury entrusted with

their examination. er examination. We shall conclude these general remarks upon Naval Architecture, with some interesting documents relative to various classes of ships, which we have before ad-

The Admiralty and merchant builders having contributed a large number of models of ships to the Exhibition, for the purpose of illustrating the forms and other characteristics of ships of the most recent construction: we conceived that some record of those ships should be preserved, in order to indicate the present state of naval architecture in Great Britain.

With this view we present a series of tables, con-taining the principal dimensions, and such other mathematical elements, relating to the construction of these ships, as could be obtained.

Table 1, (page 212), contains the dimensions and calculated clements of a complete series of sailing-ships,

from a first-rate man-of-war to a small brig. Within the last twenty years, ships in the navy have constructed with greatly increased width, or lith of beam. To some extent, this increase of breadth of beam. breadth may have been necessary, to enable them to sustain,-without too great inclination under sail,-the increased weight of armament now placed on board ships of war by most naval powers. But the general opinion, founded on the result of experimental trials of these ships, with those of former years, is-that breadth of beam, when carried to excess, contributes to make the

ships roll quickly, and in some cases deeply also. As this is a most serious evil in ships of war, materially affecting their efficiency in the use of their guns, ships of more recent construction have had increase of length as well as of breadth given them; but the latter to a less extent;—thereby obtaining the requisite amount of stability without rendering them liable to those sudden impalses produced by great breadth at the water's suralone, which causes the side to round greatly wards, both above and below the water-line. The ships referred to are, nevertheless, a very fine class of ships; and in the "Queen" we see a first-rate ship, combining with great speed, stability, easy motion, and every other

with great speed, smoothly, easy metric, and except sessential property of a man-of-war.

Table II. (page 213), contains the principal dimensions and other elements of a number of frigates constructed by different persons with a view to competition. Several of these frigates have been attached to the late experimental squadron under the command of Commodore Martin, for the purpose of fully testing their sailing and other properties as ships of war. The results of these trials, in so far as they have as yet been determined, have been indicated in a Report ordered to be printed by the House of Commons, on the 1st July, 1851. The super-ierity of saining was in favour of the "Phaeton" over other frigates similarly fitted. Her superiority was mainother frigates similarly meet. Let appearing in the trim of the rival frigates, the "Leander" and "Arethusa;" but the "Arethusa" had the advantage over the two others in respect of stowage, and she sailed better than the

Table 111. (page 214), gives the principal dimer and other elements of several brigs which have been tried together at sea for the purpose of ascertaining their relative merits in regard to sailing and other necessary qualities for vessels of this class. The results of the trials of the brigs, in Table III., are

" Leander

given in Captain Corry's Report, published in Parlia-mentary Paper, No. 394 (A), Session 1845.

Naval architectore, as far as it concerns ships moved

hy wind and sails, bas thus presented to us many im- very solid and sufficiently light, have greatly advanced

provements. But we have now to speak of progress, by far more complete and important, in ships moved by the power of steam.

A. PADDLE-WHEEL STEAM SHIPS.

Many persons, in various countries, claim the honour of having first invented small boats propelled by steam. But it is to the oadaoated perseverance and exertions of the American, Fulton, that is due the everlasting honour of having produced this revolution, both in naval archi-tecture and in unvigation.

When the general peace took place in 1814, there was not a single steam-ship in the ports of England; Scotland, however, had one small vessel of this kind. For several subsequent years, steam-boats, of small size and with very insignificant engines, were employed in rivers or along the coasts, but the idea of going far out to sea with them was considered very presumptuous.

In 1818, however, an American captain traversed the Atlantie in a steam ship, the "Savanush," tooching first at England, and then proceeding up the Baltic to St. Petersburgh.

About seven years after this steam was applied to railway travelling on shore; and then it was that most important attempts were made to extend the power of steam to long voyages by sen, and to the passage across the Atlantic from England to the United States. In accomplishing this, however, far more powerful engines, and much larger ships than bad yet been boilt, were abso-lutely requisite. The examination and judgment of such engines will be found under the Report of another Jury (Class V.).

Stenm was soon applied very generally, both to the commercial navy and to ships of war; a main object being—the application of such velocity combined with economy and safety as would induce persons to travel

To procure such a velocity, it was not enough to increase the propelling power; it was also indispensable the properties of the vessels, to distinct the vessels, to diminish the bulk of the prow and stern, to reduce the breadth, and proportionally increase the length. In this way the forms of steam-ships have been made very similar to the properties of the province of the properties of the province of the lar to those of the galleys of ancient times; wheo, instead of steam power, human labour was applied to propel the vessel by means of pars; whereas, now, the mechanical force is transmitted by the puddles of wheels or screws acting longitudinally.

Sneb is, at present, the empire of man upon the sea, that calms, contrary winds, and adverse currents, for-merly so detrimental to speedy navigation, are quite overcome. Periodical steam-ships start and arrive on fixed days, and almost fixed bours, at the ports of Liverpool or Havre and New York; as well as from London or Marsellies to Constantinople and Alexandria; and from Sucz to Bombay, Ceylon, Calcutta, Singapore, and Hong Kong. Contracts are made between the Admiralty of Great Britain and steam Navigation Companies, obliging the vessels of the latter to cross the Atlantic and the Mediterranean, at the rate of at least 9 miles an hour, taking all the chance of contrary winds. Great Britain, ever attentive to the preservation of her maritime power, looks upon the great steam-ships, hailt by private Companies, and under contract with the Government, as a valuable reserve in case of war; with this view, special articles of the contracts with the Companies oblige them to build their ships of wood and not of iron, because, with the latter material, they would not be so fit for defence. as we have already explained. At the first signal of war, the Admiralty would, from this source alone, have an anvillary steam pays of 20,000 horse nower! The exauxiliary steam navy of 20,000 horse power! ertious of private speculators, and of the English Governertions of private specialators, and of the ringuist Coveri-ment, during the last filten years, in securing the conveyance of letters, valuable goods, and passengers between Europe, America, Africa, and Asia, are deserv-ing of the highest admiration. The many rich and powerfol Companies engaged in pronouting similar undertakings, by ordering steam ships to be built of great dimensions, either of wood ar iron, so as to be at once

the science of naval architecture. We have to award Medals to several eminent shipbuilders who have presented the Exhibition with models of the excellent steam-

ships which they have lately designed and constructed. We should have been glad if the great maritime nation of America, instead of sending incomplete and imperfect models or drawings of their steam-ships, had fornished us with the requisite data for estimating the degree of perfection arrived at by their best shipbuilders, so as to have enabled us to recognize their incontestable merit. The United States cannot, at present, compete with Great Britain in the number of their great and regular communications by steamers, although on the lines opened by them, they are nothing inferior to their mighty The depth and vantoess of the rivers of United States, such as the Mississippi-the greatness of their lakes, which are indeed so many inland seas, have enabled the Americans to build steamers which may be considered as floating cities, and which satisfy the wants of the greatest way-faring nation of the world. The Americans, however, are to be reproached for their recklessness, and the little care they take to avoid evident peril. Catching fire, blowing up, or foundering from the effects of the latter-accidents which a little foresight might have prevented-are considered and accepted by them as casualties very little to be regarded. hrave these dangers knowingly, and to meet competition with a rival ship. Hence the accidents which occur are with a rival sop. Treme the accounts when over any frequent and dreadful, and still they do not teach the commercial navigators to be more circumspect. The steam-ships of war, however, reserving danger for the time of hattle, exhibit, on the contrary, a prudence which

makes whostly aniswerient to neutril.

In the Bettim say unset has been done, experimentally, for the best application of atom power to matul architecture of the season o

Several French professors, engineers, and naval officers, have made some interesting experiments on steam propulsion, with ships varying in form and size. The exarches and experiments on Means. Boargois and Moll have been already proclaimed and recompensed by the National Incitize of Prance. These gentlemen are still office of the control of the Con

timent did not contribute examples of their naval architecture to the prest Exhibition. The Norwegians and Swedes, those excellent and hold margators, have not sent any models or designs of the ships they emplay either on the ocean or the Baltie. Their shipholiders, inheritors of the science and art of the celebrated Chapman, *would have figured honorably, even in comparison with the most advanced seafaring people.

* The eminent author of Architectura Navalis Mercutoria, Stockholm.

navigation of the Rhone, the most rapid and dangerons of the Freuch rivers. M. Schneider,* of Creuzot, constructed these ships and their machinery.

In twelve years there have been built at Cruzot, for the Rhone, under the direction of M. Schneider, It is steamers, the first of 89 horse-power, and the last of 700, earry 620 loos, and to overcome a mean velocity of the control of the control of the control of the control ing from Arles to Lyons in 36 or 38 hours. Other scenares, built for possengers, under soil quicker voyages. Machinery for war steamers has level constructed for the power, with remarkable species.

SCREW-PROPELLER STEAM SHIPS.

The application of the screw-propeller to ships of war is of comparatively recent date, but has, a now this sanding, been so successful as to lead to the expectation that is till ultimately be generally applied to ships in the mavy, either with full or saxiliary steam-power. The first shap in the navy to which the screw-propicler was applied was the "Hartler," of ses tons, in which, with engines of the "Hartler," or ses tons, in which, with engines of the "Hartler," or ses tons, in which, with engines of the control of the co

possessing powers and capamitine in an accordance of ordinary uniting ships,?

The speed obtained by steam-power alone, varies, in these ships, from 64 to 74 knots per hour; and by sail and steam combined, a speed of about twe knots more than that which sail alone would give, is frequently abtained, with the power of sailing closer to the wind.

The forms of "La Hogae," "Bencheim," and "Ajns,"

Intercritis or "La nogue," "bledneshi," and "Ajax, athough more or less altered ability to adopt them for the screw propeller, cannot be regarded as altogether well suited for its effectual operation. Daily experience shows ability of the property of the

tile may with those of the royal navy, it will be seen that screw-ships, for this service, are of still greater comparative length than in the royal navy; and that, in consequence, still better results have been obtained. The following table (see p. 216.) contains the dimensions and some of the calculated elements of a series of

ENUMERATION OF THE AWARDS FOR NAVAL PURPOSES.

screw-ships of the most recent construction,

Council Medals.

 To the Admiralty of Gerat Bestain (p. 544), for a magnificent set of models of ships moved either by rails

 To M. Schneider, when minister, we are indebted for the selection of the thirty-six French Jurors and Associates sent to the Exhibition.

† As some as the conditions of this new problem of narral architecture were known to the public, Baron Charles Dupin, in a report to the French House of Feers, announced in positive and strong terms, the great success to be expected from memodwar so fitted. He pointed out the new services which they could fadili, not merely as harbour guard-ships but no a squadron of attack, for the remotest points of the European seas, and even farther.

 Transverse sections.

The Admiralty, by the comparative trials they have ordered, have contributed in a very bigh degree to the most recent progress of naval architecture. They have equally contributed to the progress of bydrography, as I shall explain when speaking of the maps presented to the Exhibition, which are included in this award of the Council Media.

2. To Sir William Snow Harris (150, pp. 345, 346, and illustration). Science and humanity proclaim the merits of Sir W. Snow Harris's inventions. He has exhibited practical models of his system of attaching lightning conductors to the masts or hulls of ships, which has been for

everal years in general use in the British Navy.

As a means of preserving life and property from the effects of lightning, nothing has proved more completely successful and effectual than these conductors. The transmission of the electrical discharge from mast to mast, and finally from the conductors in the hull to the water, is perfectly effected under all circumstances, and in every position of the spars or of the ship when pressed by sail, and without demanding any care or attention on the part of the officers or crew. The mechanical arrangement of the plates forming the conductor, which is of great capacity, is such as to admit of their accomdating themselves to any flexure the spars can sustain. whilst at the same time they preserve a fair and con nuons conducting line. The various branches or subdi-visions in the hall allow of a free dispersion of the electrical agency in all directions to the bottom of the ship, and into the sea, hy which the tension in any one point is so reduced that explosive action is next to impossible. For these reasons a Council Medal is awarded to Sir W. Suow Harris

3. To His Grace the DUKE OF NORTHUMBERLAND (136, pp. 342, 343).—To the humanity of His Grace the Duke of Northumberland, to his unbounded liberality and generous encouragement of practical science, we owe the numerous efforts of able men to construct life-boats calculated to meet the perils of an ocean tempest. They must be easy to manage, io order to accomplish the great object for which they are designed, viz., the saving of life and property endangered by sbipwreck. His Grace, with this philanthropic view, has expended some thousands of pounds in obtaining for the coasts of Northum berland, an improved class of life-boat, designed and huilt in consequence of the premiums the noble Duke has offered. Models of these very bonts figure amongst the most valuable contributions to the Great Exhibition, and furnish a splendid example of liberality in the cause of humanity and practical science never surpassed, if ever equalled Such are the motives nader which we have dged His Grace the Duke of Northumberland worthy of receiving the Council Medal.

Patze Medals.

A. Seif-Building.—British Department, The Honourable the Corporation of London, for

Illustrations of the art of ship-building for the commercial marine, almost all showing the greatest and most important improvements in strength, symmetry, and efficiency; and mostly coming from establishments within the jurisdiction of the port of London,

Mr. T. I. Dyrentons (30, p. 434), for models of paddle and serew steam-vessels, both wood nod iron, designed and huilt hy him for various services, including yachts. Mesars, Gaers (131, p. 342), at Blackwall, for a nodel of the fine merchant vessels designed and built by them for the East findia trade. Messrs. C. J. MASS: and Co. (149, p. 344) for models of fine sailing and steam vessels, both paddle and screw, designed and huilt by them for various merchant services, including yields.

Messrs, Robinson and Russell (193, p. 349), for fine models of steam-boats, designed and built by them. The Royal Thames Yacur Clun (294, p. 359), for models of the vessels belonging to their Club, which are

models of the vessels belonging to their Club, which are of a most interesting character. Mesers. Thomas and William Smith (305, p. 360), for a model of the fine merchant vessel designed and

for a moner of the nne merchant vessel designed and built by them for the East India trade. Mr. Joseph White (38, p. 336), for fine models of vessels, designed and built by him for the merchant

vessels, designed and built by him for the merchant service, including yachts. Messrs, T. J. and R. WHITE (36A, p. 336), for models

of foe salling and steam-ressels, designed and built by them for the merchant service, inclinding yachis, them for Mover Woo an and Soon (66, p. 206), for models of fine chaese of salling and steam-ressels, both paddle and serw, built by them for various merchant services.

French Department.

M. Barnorin, captain of the French Navy (1083, p. 1230), for his improved capstan for ships of war, adapted to the use of chain cables.

to the use of chain cables.

M. LAHURE, of Havre, Seine Inférieure (285, p. 1190), for an insubmersible boat for the use of the military and commercial services, combining very ingenious arrange-

M. Le Gorr, captain of a frigate in the French Navy (1083, p. 1230), for his powerful stopper in the management of chain cables.

ment of chain cables.

M. Schneider, of Creazot (1475a, p. 1246), for a large specimen of the machinery of the steam-boat "L'Oceau," built by him, for the River Rhone, by which great speed

and convenience have been obtained.

M. Sconzy, engineer of the French Navy (1478), for his valuable apparatus for distilling suit-water on board ships of war.

M. ROCHER, of Nantes (991, p. 1226), for his large ap-

nocenes, or some self-up, p. 1226), nor me large apparatus for distilling self-upter on board stips of war, and for his inexhaustible submirrine condenser.
 American Department.

Mr. S. M. Pook (446, p. 1464), and Mr. W. Darron (449, p. 1464), exhibiting through the National Institute of Washington, for several models of ships of war and large merchant vessels.

B, VARIOUS OBJECTS CONNECTED WITH THE NAVAL SERVICE.

Mr. C. Asskil (185, p. 348), for a gunning pant, on new principle, for fowling purposes.

a new principle, for favoling parpores.

The Rev. E. L. Bearmon (19th, patchasing headand levels of the patchasing head and
levels of the patchasing head of the patchasing head
and levels of thins. 2nd. Of his patent clionoreter, for
a howing the inclination and trim of ships. 2nd, of a

declaration of the patchasing head of the patchasing of the
strength, capearity, and lightness; and which under
many circumstances might be found most serviceable,
where rivers have to be crossed. When it is country
where rivers have to be crossed.

Sir Sauter. Baow N. Capt. R.N. (334, pp. 331, 332), the inventor of the chain cables introdeed in sea service, for suspension bridges and piers, and for a model of largeniously disposed slips for the purpose of hauling up ships to repair.

Mr. ALPRED Fox, for fine specimens of nets, seines,

&c., for pilebards.

Mr. J. J. (incom, for fine specimens of deep sea fishing lines and books.

ing-lines and hooks.

Mesers, Jeffert, Walsh, and Co. (188, pp. 348, 349), fin the marine glue, most successfully used as a substitute for pitch in the sense of decks, as well as for uniting

large timbers for naval purposes.

Lient, Janes Rigmaturn, R.N. (291, p. 359), for the model of his plan of lanyard plates for setting-up the standing rigging of ships.

Lieut. W. Rodgers, R.N. (336, p. 361), for his very remarkable improvements in the form and proportions of anchors Mr. J. E. Saunders (Class XXIX.) for the model of a

smack for fishing, fitted with an auxibary screw pro-peller, being a new application to vessels of this descrip-

Messrs. J. and T. W. SIMMENS (124, p. 340) for the model of a "Mount's Bay" fishing-boat, which is a very fine description of boat for its purpose.

Mr. S. Sattu (125, p. 340), for a model of a spring machine for modelling ships of any dimensions, offering au ingenious and ready means for setting up a design in

Mr. G. Turr (Class XXIX., 185), of flye, for the mo-del of a "Hastings" fishing-jugger, which is also a very good description of boat for its purpose.

The following competitors for the prize of one hundred grainent, offered by His Grace the Duke of Northumberland, to mark our sense of the excellence of the models they furnish :

they furnish:—
Mr. Janes Becchino (136, p. 342), Mr. Henry Hines
(136, p. 343), Mr. William Teamle (136, p. 343), Mr.
J. Plenty (p. 343), Mr. E. Pellew (p. 342), Mr.
J. Plenty (p. 343), Mr. B. Pellew (p. 342),
Pecusiary Rewards.—Mr. Joseph Bothway, for improvements in the construction of blocks combining strength with much less weight, and other advantages,

Mr. David Harvey (159, p. 346) for the excellent execution of the small model of the "Victoria and Albert," royal yacht, 401.

Mr. ALEXANDER BIRNIE, of Peterhead, for nets, lines, and hooks, 5%. Mr. H. DEMPSTER (174, p. 348) for an ingenious sys-

tem of signals for merchant ships, 204.

Messrs. Thomas Bibas and Co., of Rotherhithe, exhibit a model illustrative of a novel arrangement of the timbers, with a view to increase the strength of the fabric of merchant ships, and add materially to their durability.

Mr. Joseph Weln (186, p. 348), of Lulworth Castle, shows a model of a 12-oun brig of war, with a view to

snows a movel of a 12-gun orig or war, with a view to obtain, scientifically, the advantages of speed. Messes, J. and J. Loxo and Co. (7t, p. 387), present several plans of steering wheels of very simple construc-tion, giving to the helassman a perfect control over the rudder.

C. NAUTICAL INSTRUMENTS.

This Jury had but a part of the collection of " Philosophical instruments in use for the navy," left to its exination, the other portion being remined by Jury X. We would particularly refer to an azimuth compass, coming from the Compass Department of the Admirally (p. 344). This instrument, for making observations at sea, combines improvements in workmanship, suggested

hy long experience; the centering and adjustments are This excellent piece of art merits a Prize very good. This excellent piece of art merits a Prize Medal, but being a Government instrument no award has been made to it

We award a Prize Medal to Mr. E. J. DENT (Class X, 55, pp. 413, 414), for his marine compass. It has long been a desideratum to construct a compass that should not be disturbed by the motion of the ship, or by the firing of the guns. One of Mr. Dena's compasses has been, by order of the Admiralty, repeatedly tried at sea, and particu-larly on board the "Excellent," as to the effect of cannon pon it. Even during heavy weather, with the sea any chere before the beam, the reports are highly favourable. The firing of heavy cannon within nine feet of the compass had no visible effect upon it; whilst the ordinary compasses deviated several points. In boats, the same instrument has also been found particularly steady. The particulars of this instrument are-first, excellent

workmanship; its card is fixed upon a vertical spindle, instead of upon a pin resting in n cup, and it is retained in its horizontal position by the bowl having a pendulum action. The disturbing effect which both gravity and dip would have upon a magnet fixed on a spindle when out of the perpendicular, has been considered by Mr.

Dent, and a compensating power applied. instrument of similar construction, but with a double needle apon gimbols in the centre of the spindle has been also presented by Mr. Dent, but it has not yet been tried at sea. Here the motion given to the needle, if duly

balanced, seems to be an improvement,

A third instrument of Mr. Deut's, a portable azimuth compass, is worthy of notice as an ingenious invention to overcome errors in the centering of the needle, and in the direction of the magnetic axis as placed by the maker, by n method of inverting the box, not hitherto in use.

in internal or intering the sols, not afthere in Messre. NAPIER and Sox of Lambeth (Class VI., 108, p. 285), for an instru-ment for registering the magnetic course of a wessel as actually steered. The card, as usual, is placed upon a cup centred in a brass plillar; but this pillar, instead of being attached to the bottom of the bowl, protrudes, and is attached to machinery which partakes of the mo-tion of the bowl. Every three minutes the pillar carrying the eard is raised by the muchinery, and the card receives a puncture from a fine point placed above it, in the direction of the ship's head, and attached to the how! inside the glass cover, after which it descends immedistely to its former position. In the course of twentythe card towards its centre, passing over twenty-four concentrio circles which mark the hours; so that not only is any alteration of the course detected, but the hour at which it occurred is also shown by the card. This compass, with the aid of the log, may be said to form a traverse table of the ship's route for the day.

Honourable Mention is given to Mr. HUGHES (Class X., 691, p. 472*), for his compass in spirits. Such au instrument has been found valuable in heavy seas during the firing of cannon, and especially in boats; but hitherto the necessity of leaving a space in the bowl (which has, until now, been of metal), has produced an injurious effect apon the needle and apon the steadliness of the fluid. Mr. Hughes has overcome this evil of the airbubble by an elastic bottom. His instrument is further recommended by its cheapness,

American Department,

Mr. Sr. Janx* of Buffilo (95, p. 1439), deserves the Prize Medal for his compass, which, to the ordinary one, adds two small needles placed upon pivots over the east and west points, with indices pointing towards the centre of the card, and each having a graduated circle marked E. and W., on either side of their zero points. These small needles are called satellites; their object is to show the presence of any disturbing force upon the needle, and also to indicate, by the mean of their readings, the amount of the deflection; but this last desideratum in amount of the detection, that has a source and ingenious, and if it could be improved in this respect, it would become an instrument of great practical importauce on board vessels, especially in those of iron,

D. INSTRUMENTS FOR MEASURING THE RATE OF A VEN-SEL THROUGH THE WATER

One instrument of this kind is mentioned for an award in the section of Naval Architecture, and belongs to the Rev. E. L. BERTHON.

Two other instruments for measuring the rate of a vessel through the water are due to Mr. Sr. John (542, p. 1448), who received a Prize Medal for his company. One of his instruments consists of a rotator, which acts npon a spindle protruding through the bottom of a vessel by means of a copper cylinder in the hold rising above the water-line of the ship. The other consists of a small instrument connected with and disengaged from the ordinary log-line, by the turning of the glass which measares the interval.

Mesers. Ellior and Soxs, of the Strand, London (320, p. 413), exhibit two small convenient instruments for measuring the rate of running water. They are very

* This exhibitor has been awarded a Prize Medal by the Jury of Class X., in whose list his name appears,

portable, and have been used by civil engineers with

E. INSTRUMENTS FOR MEASURING THE DEPTH OF THE

A Prize Medal is given to Mr. Enicsson,* of New A PTIZE Mean in given to Mr. Enterson. of New York (Cl. X., 146, pp. 1442-1446) for his instrument for measuring depths, by the compression of atmospherie air. It is a modification of the one known in the British Navy as Ericsson's Sounding Lead. Capt. Beechey, R.N., one of our fellow-jurors, made use of it for several years in a ship under his command; and experience has shown him that it was a good instrument when the depths were under 50 fathous Mr. Eriesson attributes the idea of under 50 fallooms. Mr. Erresson attributes the idea of his instrument to Mr. Agden. But seventeen years be-fore it came out, Sir Humphry Davy's seater-bottle was in use in the polar expeditions; an instrument upon the same principle, although greatly inferior to Mr. Eriesson's in the extent of its scale.

All the depths here mentioned were under 50 fathoms. F. APPARATUS TOR SAVING LACE

Having already awarded medals to the inventors of boats for saving men's lives and property, we have here to consider other means for effecting the same object.

1. By effecting a communication to and from a Ship in peril and the Shore.

We must, in the first instance, mention here Capt. W. G. Maner, R.N. (22, p. 335), so long known as the introducer and zealous promoter of the object of saving life from shipwreck, by means of firing a projectile, with a line attached to it, from the shore to the ship, which has been used with grent success along the coasts of Great Britain, and has rendered remarkable service.

M. G. DELVIONE, of France (473, p. 1200), employs a howitzer to obtain the same result as Captain Manby, This invention involves this new principle, that a portion of the line to be carried is contained is the projectile. The idea scems capable of successful application.

Captain Jerningham (21, p. 335), of the British Navy, has an ancoor of a particular form, which he proposes to

fire from a Manby's morter, in sufficient numbers to afford the means of hauling a life-boat through the surf. Prize Medals have been awarded to the above three Exhibitors.

EXHIDITORS.

Mr. GREENER (59, pp. 336, 337) exhibits a method of discharging a rocket, with a line attached, from a harpon gun. When discharged the rocket ignites, and is said to prolong the range to a greater distance than would be effected by cither the gan or the rocket alone. The gun is distinguished for its lightness and efficient

Mr. A. G. Carte (29, p. 335). This exhibitor has been distinguished by his great real in carrying out the object of saving life by means of a rocket. His plan is, to employ a war rocket, instead of the well-known rocket of Dennett,

2. By meens of Rafts, &c.

Mr. W. G. RHIND, of Ross, Herefordshire (290, p. 359). presents various models of deck-seats and benches for This artifictor has been awarded a Princ Madel by the Jury of Class X., in whose list his name appears.

steamers, so constructed as to be readily formed into rafts, each one sustaining eight persons. A Prize Medal is awarded to Mr. Rhind.

3. By means of Buonast Air tobes. Mr. S. W. SILVER (195, p. 350), exhibits buoyant mat-

tresses, naunfactured according to Mr. Laurie's inven-Mr. Silver connects approcross waterproof tobes. partly distended with horse-hair, woollen flocks, or coconunt fibre, in such a manner, that in case of accident happening to one or more of these tubes, the others may be sufficient to sustain the required weight on the water. The tubes are made up into mattresses, pillows, and also into floats, to be pinced under the thwarts of boats A mottress, weighing only 17 lbs., sustains in the water 284 lbs. A pillow sustains 28 lbs. Muttresses for

emigrant vessels, sold at St., sustained 96 lbs. in the water for five days, without being in the least affected. A Prize Medal is awarded to Mr. Laurie as the inventor

Mr. A. G. CARTE (29, p. 335), already mentioned, exhibits a very simple, cheap, and efficient life-baoy, which has been in general use since 1838, and is reported to has been in general use since 16-38, and is reported to have preserved 400 persons from drowning. A Prize Medal is awarded to Mr. Carte. Messrs, Esdalles and Maronave (126, p. 340) exhibit

floating mattresses, filled wish cork shavings; worthy of praise.

PART II.

MILITARY ENGINEERING, ORDNANCE, ARMOUR, AND ACCOUTREMENTS.

When I first visited Great Britain, very soon after the general peace in Europe, I found a very strong prejudice ngainst the value of military institutions, and everything belonging to the army of this country. It may be easily conceived that foreigners would be anxious to learn everything connected with the navy; but nobody imagined that the land forces could present models deserving the closest attention of military observers. Having visited, bowever, the great arsenal of the Ordnanee ni Woodwich, the schools for the engineers and their traops at Chatham, and the school of the general staff at Faruham, I was deeply convinced that, on the contrary, Great Britaiu merited the most attentive observation in order to appreciate doly the bigh value of her land military forces institutions, and exercises. At this period she possessed the best system of land-artillery, a system which united solidity, simplicity, security, and rapidity. The carriages for field-pieces allowed the gunuers to be carried along with the guus, as rapidly as light cavalry, as well as the caissons which contained the necessary ammunition. All the wheels, before or behind, of every kind of earning for the field batteries, being equal and identical, could be replaced most easily; the draft being more easy, and the overtbrow of the carriage more difficult.

Such were some of the rare qualities, due to the exertions of General Congreve, of an artillery which all the military powers adopted very soon after a description of it had been published.* To General Congreve also is due the employment of rockets, in the army, as projec-tiles,† They wanted at first the most important quality of precision in the direction. A better construction by degrees overeame this difficulty. The French, the Germans, the Prussians, &c., have studied this new kind of weapon, and tried the use of them in warfare; but not

with very great effect. Fortifications did not present novelties of so high a value, but still they deserved to be studied in Great Bri-tain. Medeis of the ancient and new fortifications in Grent Britain were presented to the Exhibition, No.

* In the Force Militaire de la Grande Bretagne, Paris, 1820, 2 vois. 4to., with arins.

† There were two Congresses, father and son; the former

Introduced great improvements in the construction of artillery carriages and indicated rockets. The son (the late Sir Congreve), undertook to develop their construction and application.

inventions relating to the attack or defence of places have been sent in; so that we cannot speak of the merit either of officers or workmen employed in military engineering, however eminent they may be. We have from other nations, some remarks to make on the subject of ordinance.

A. CANNON, AND THEIR CARRIAGES. The articles exhibited under this head are few in nur

ber. It has, apparently, been felt, that since it is the main object of the Exhibition rather to suck shows the progress and to promote the stre that said to the comforbe explaine simpleyed in war, such engines employed in the complex of the complex of the complex of the comception of the complex of the complex of the complex bere. Thus it is that France, no capable of illustrating all that relates to the branch of the art of war, continlated that the complex of the complex of the complex of the British next anything. If from other countries we have received some articles that seem to belong to military warfare, they appear to have been sent malars as sampleof manufacture and of matericks, that for their original.

These observations are specially applicable to the very remarkable spicinisms of wrought-tron guns, presented by Spini and Turkey, not as the best pieces of ordinance that can be produced, but as very extraordinary samples of energy and ingenuity of production under circumstances of accessity and difficulty, where recome could not be had to ordinary manufactories, and where these serviceable notification of the production of the constrained of the control
grader upon it than upon casi lono or a blussar, anticically fight to be carried upon camede. The vents exhibit a greater or less colargement; but there is no description of the internal figure, nor nat the particulars given of the charges or rate of firing. All these pieces appear to be well mannfactured, and of very good material, and they are clean from the sand, without being turned.

Praisin has presented a c-pounder field-gen, 34 fort long, of a new suterial-mainty cast steel, forged hybe thammer, mounted on a carriage of 3 feet site, and unsurfictured by Mr. Kurry, of Esser, neer Dunseldurf. The merits of Mr. Krapp, and his ability in working from and steel, are pre-kinged, and will be enumerated in common we movely mention here the remarkable beauty of the workmanking of the piece of orlangence alluded to.

Besides the above the Jury have noticed the follow-

Captain TYLDEN, R.A. (275, p. 558), has presented a series of fine models of the constructions of guns for the English service, on the scale of 1½ inch per foot, with a sea-service 13-inch mortar, a 10-inch howlizer, and 32-pounder gun, on garrison carriages, and a light 6-pounder field-gan and limber. These are all well executed, hat without any novely of construction.

MUNRO, J., Jun. (282, p. 358), two very correct and finely-finished models of a 9-pounder field-gun and limber, and a 24-pounder gun,

and a 24-pounder gun.

The Honormank East India Company (pp. 911, 912) have exhibited a series of models showing the construction of artillery used in the East Indies for siege and field service, on the scale of 14 inch per foot. These models are well executed; but they do not appear

present any particular object of preference.

There are also several camel-gans, as well as some hrass field-gans, of Indian construction, proper to illus-

trate the modes of Indiao warfare.

The Hon. Captaio FITZ MACRICE (283, p. 358) exhibits two models to illustrate his mode of pointing, applied to a carriage-gun and a mortar, by means of a horizontal

to a carriage-gun and a mortar, by means of a horizontal endless screw, acting at the segment of a wheel. Messrs, C. A. and T. Fergusson (84, p. 332), of Mill Wall, Block and Gun-carriage Manufactory, two pieces of ordnance, mounted for sea-service, with particular dispositions.

B. SMALL ARMS. A great number of nations have sent small arms to the Exhibition; several of them such as are used for war,

but by far the greater number being for sporting penese. Three nuitoes are promisent for the construction of small arms, the English, the French, and the Belgiums. Small arms for war and for the cheer, are mannefatured at Ifraningham, the one with due solidity, the others with refinements of workmanship. This last class is, however, sparing of ornaments.

Liège is the Birmingham of Belgium, and has a large

Bowever, sparing or ornaments, Liège is the Brimingham of Belginm, and has a large monnfactory of both kinds of guns. The Belgians, on account of cheapness, combined with good execution, sell a great quantity of small arms to other nations, particularity to Russia.
